Joshua N. Milligan

Preface

When Tableau was first introduced, it was a dramatic paradigm shift away from tabular reports and extensive cycles of data integration that produced results long after relevant decisions could have been made. Tableau disrupted the paradigm for visually interacting with data. And it continues to offer a unique paradigm — one that makes it easy and intuitive (and fun!) to be hands-on with the data, to receive instant visual feedback with every action, and to ask questions and uncover insights in a natural flow of thought and interaction. The result is an ever growing **#datafam**, a community that loves Tableau for its simplicity, beauty, and ability to make working with data fun!

Tableau continues to expand and evolve in ways that make seeing and understanding data easier and more powerful. The Tableau Data Model, new dashboard actions, ever-growing geospatial support, animations, and new dashboard objects expand what's possible and make it easier than ever to gain and share insights from data. New features such as dashboard extensions allow you to go beyond the built-in functionality and integrate Tableau fully into analytic workflows. Einstein Discovery brings the power of AI and powerful predictive models to your analysis.

The continued evolution of Tableau Prep brings the same intuitive instant feedback to data prep and cleansing that Tableau Desktop brought to data visualization, greatly extending the analytical platform of Tableau. We'll cover these new features (and more) in the chapters of this book!

We'll look at Tableau through the lens of understanding the underlying paradigm of how and why Tableau works, in the context of practical examples. Then we'll build on this solid foundation of understanding so that you will have the tools and skills to tackle even the toughest data challenges!

Who this audiobook is for

This book is for anyone who needs to see and understand their data! From the business user to the hardcore data analyst to the CEO, everyone needs to have the ability to ask and answer questions of data. Having a bit of background with data will definitely help, but you don't need to be confident with scripting, SQL, or database structures.

Whether you're new to Tableau, or have been using it for months or even years, with this book you'll gain a solid foundation of understanding Tableau, and the tools and skills to build toward advanced mastery of the tool.

What this audiobook covers

Chapter 1, Taking Off with Tableau, introduces the foundational principles of Tableau. We'll walk through multiple examples in a logical progression that will introduce everything from the interface to connecting to data, building your first visualization, and even building a dashboard. This chapter will give you a solid foundation for terminology and concepts that will be used throughout the book.

Chapter 2, Connecting to Data in Tableau, covers the foundational concepts involved in connecting to data, using several practical examples. It covers the various types of connections, file types, cloud-based and on-premises databases, and how to work with metadata.

Chapter 3, Moving Beyond Basic Visualizations, builds on the basic visualization principles covered in the first chapter to explore variations and extended possibilities. You will learn when and how to use a wide variety of visualizations to analyze and communicate data.

Chapter 4, Starting an Adventure with Calculations and Parameters, introduces calculations and parameters, giving an overview of the major types of calculation and then detailed examples of row-level and aggregate calculations. It combines conceptual knowledge with practical examples, and concludes with performance considerations.

Chapter 5, Leveraging Level of Detail Calculations, takes an in-depth look at the level of detail expressions and how to use them to solve complex data challenges. It not only gives an overview, but dives into examples of FIXED, INCLUDE, and EXCLUDE variations.

Chapter 6, Diving Deep with Table Calculations, gives you a strong foundation for understanding and using table calculations to solve a wide range of data challenges. It covers the concepts of scope and direction, addressing and partitioning, and walks through several in-depth practical examples.

Chapter 7, Making Visualizations that Look Great and Work Well, covers how to extend and alter the default formatting applied to visualizations by Tableau, to customize

options such as font, color, lines, shading, annotations, and tooltips to effectively communicate a data story.

Chapter 8, Telling a Data Story with Dashboards, builds on concepts that were introduced in the first chapter and expanded on throughout. It walks through several practical examples of various kinds of dashboards to help you gain a solid understanding of what a dashboard is, how to build one and make it interactive, and how to use it to tell a compelling data story.

Chapter 9, Visual Analytics: Trends, Clustering, Distributions, and Forecasting, introduces the visual statistical analytics capabilities built into Tableau and supplies you with practical examples of how and when to leverage these capabilities. This includes adding and modifying trend models, leveraging clustering capabilities, using and modifying forecast models, and visualizing the distribution of data. This chapter also includes new details regarding the new features and interface present for Explain Data. You will not only understand how to employ statistical models but also evaluate their accuracy.

Chapter 10, Advanced Visualizations, builds upon the visualizations and techniques already covered, demonstrating how Tableau can be used to create any kind of visualization. A multitude of examples demonstrates a wide variety of advanced visualizations, from bump charts to Marimekko charts to animated visualizations.

Chapter 11, Dynamic Dashboards, builds your dashboard skills by demonstrating various techniques to show, hide, and swap content on a dashboard. The result is a truly dynamic user experience that enhances your ability to communicate data.

Chapter 12, Exploring Mapping and Advanced Geospatial Features, demonstrates everything about maps and geospatial visualization, from map basics to geospatial functions, custom territories, and plotting data on custom background images.

Chapter 13, Integrating Advanced Features: Extensions, Scripts, and AI, explores the incredible potential of extending Tableau's functionality using new features and integrations in Tableau. The chapter explores dashboard extensions that give you the ability to seamlessly integrate code, backend systems, and new user interfaces directly into your dashboards. You'll also see examples of leveraging scripts that could be used for anything from data cleansing to advanced predictive models. Finally, this chapter will explore the new integration of Einstein Discovery, which unleashes the full power of AI and predictive models and can be fully integrated into interactive dashboards.

Chapter 14, Understanding the Tableau Data Model, Joins, and Blends, explores the major ways of relating data in Tableau, including joins, blends, and relationships, using Tableau’s Data Model. With practical examples and detailed descriptions, you will understand the difference between logical and physical layers and how to leverage relationships, joins, and blends to achieve great analytical results.

Chapter 15, Structuring Messy Data to Work Well in Tableau, acknowledges that real-world data is sometimes a mess, and gives you a foundation for understanding well-structured data and a toolset for dealing with data that isn’t structured well in Tableau.

Chapter 16, Taming Data with Tableau Prep, explores the Tableau Prep Builder tool, including the overall paradigm and specific features. You will work through an extended practical example to understand how to leverage Tableau Prep’s amazing ability to clean and structure data.

Chapter 17, Sharing Your Data story, concludes the book with a look at a wide range of options for sharing your story. From printing to sharing interactive dashboards to output PDFs and images, you’ll be ready to share the stories contained in your data with those who need it most.

To get the most out of this audiobook

This book does not assume specific database knowledge, but it will definitely help to have some basic familiarity with data itself. We’ll cover the foundational principles first, and while it may be tempting to skip the first chapter, please don’t! We’ll lay a foundation of terminology and explore the paradigm that will be used throughout the remainder of the book.

You’ll be able to follow along with many of the examples in the book using Tableau Desktop and Tableau Prep Builder (in *Chapter 16, Taming Data with Tableau Prep*).

Most examples can be completed with almost any recent version of Tableau. New features and interfaces will require version 2022.1 or later.

You may download and install the most recent versions from Tableau using these links:

Tableau Desktop: <https://www.tableau.com/products/desktop/download>

Tableau Prep Builder: <https://www.tableau.com/products/prep/download>

Please speak to a Tableau representative for specific licensing information. In most cases, you may install a 14-day trial of each product if you do not currently have a license.

Depending on the terms of your license, Tableau also typically allows you to use your license on two machines. This means you might have Tableau installed at the office (perhaps even an older version) but can also install the latest version on your home machine. Check your licensing agreement and speak to a Tableau representative to verify details in your case.

Download the example code files

The code bundle for the book is hosted on GitHub at <https://github.com/PacktPublishing/Learning-Tableau-2022>. We also have other code bundles from our rich catalog of books and videos available at <https://github.com/PacktPublishing/>. Check them out!

Download the color images

We also provide a PDF file that has color images of the screenshots/diagrams used in this book. You can download it here: https://static.packtpub.com/downloads/9781801072328_ColorImages.pdf.

Conventions used

There are a number of text conventions used throughout this book.

CodeInText: Indicates code words in text, database table names, folder names, filenames, file extensions, pathnames, dummy URLs, user input, and Twitter handles. For example: “Connect to `Hospital_Visits.xlsx` and generate an extract.”

A block of code is set as follows:

```
IF LEFT([Room], 1) = "1"  
THEN "First Floor"  
ELSEIF LEFT([Room], 1) = "2"
```

```
THEN "Second Floor"  
END
```

Bold: Indicates a new term, an important word, or words that you see on the screen. For instance, words in menus or dialog boxes appear in the text like this. For example: “Select **Table Layout | Advanced** from the **Analysis** menu.”

Chapter 1

Figures

The screenshot shows the Microsoft Power BI Data Connection screen. At the top, there's a toolbar with icons for file operations like New, Open, Save, and Print. Below the toolbar, the title "Superstore" is displayed next to a "Connections" dropdown menu. The main area is titled "Superstore" and contains a "Need more data?" section with a "Drag tables here to relate them. Learn more" link. On the left, a sidebar lists "Connections" (Superstore) and "Files" (Superstore.pbix). A "Fields" section shows a preview of 25 fields with 9426 rows. The preview table includes columns for Name, Type, Field Name, Physical Size, and Remote. The first few rows of data are:

Name	Type	Field Name	Physical Size	Remote ...
Customer	Object	Customer	Large	Customer
Customer	Object	Customer	Large	Customer
Customer	Object	Customer	Large	Customer
Customer	Object	Customer	Large	Customer
Customer	Object	Customer	Large	Customer
Customer	Object	Customer	Large	Customer
Customer	Object	Customer	Large	Customer
Customer	Object	Customer	Large	Customer

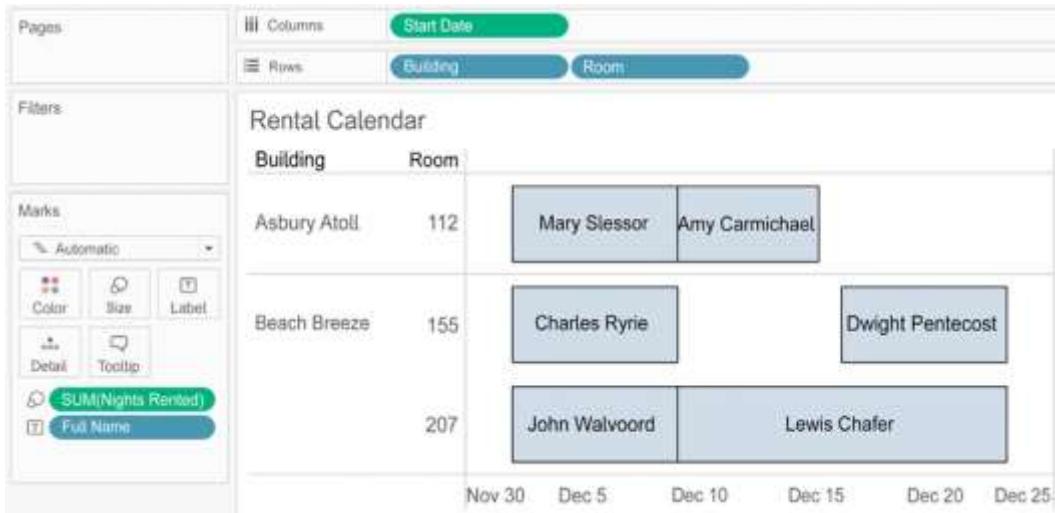

Figure 4.17: The calculated field allows us to create the Gantt chart

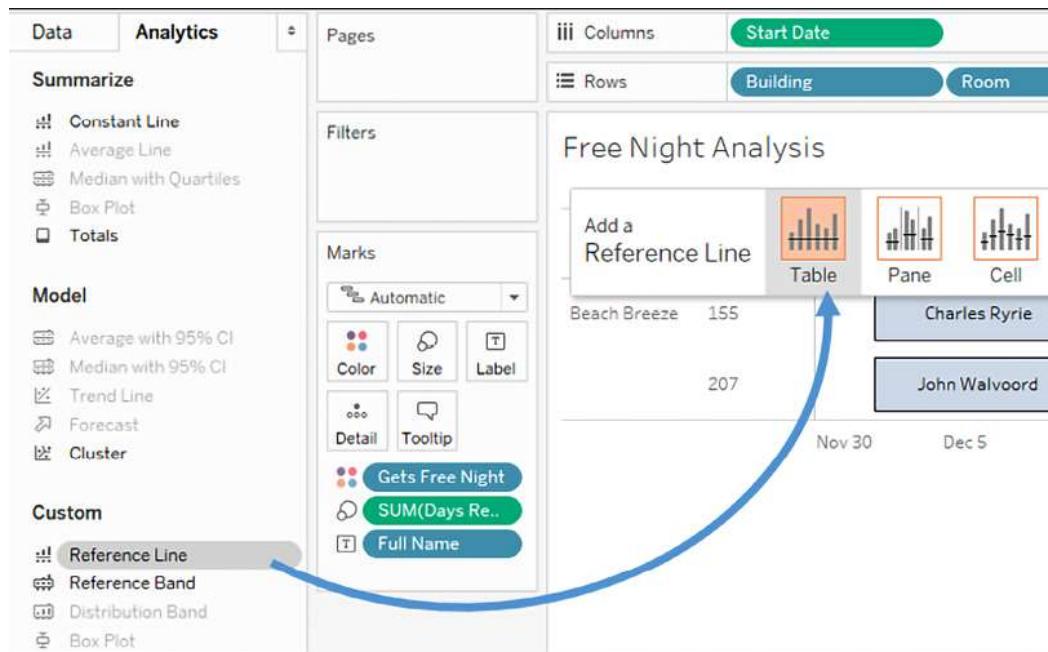

Figure 4.18: Add a reference line by switching to the Analytics pane and dragging the reference line onto the canvas

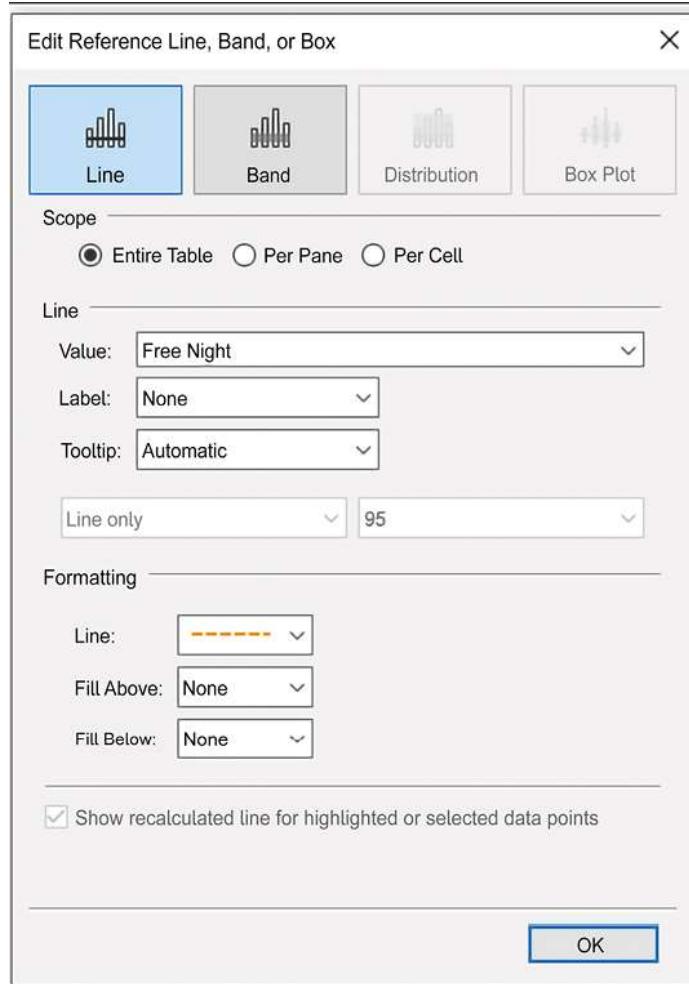

Figure 4.19: Use the Edit Reference Line dialog to adjust the formatting, labels, and tooltips

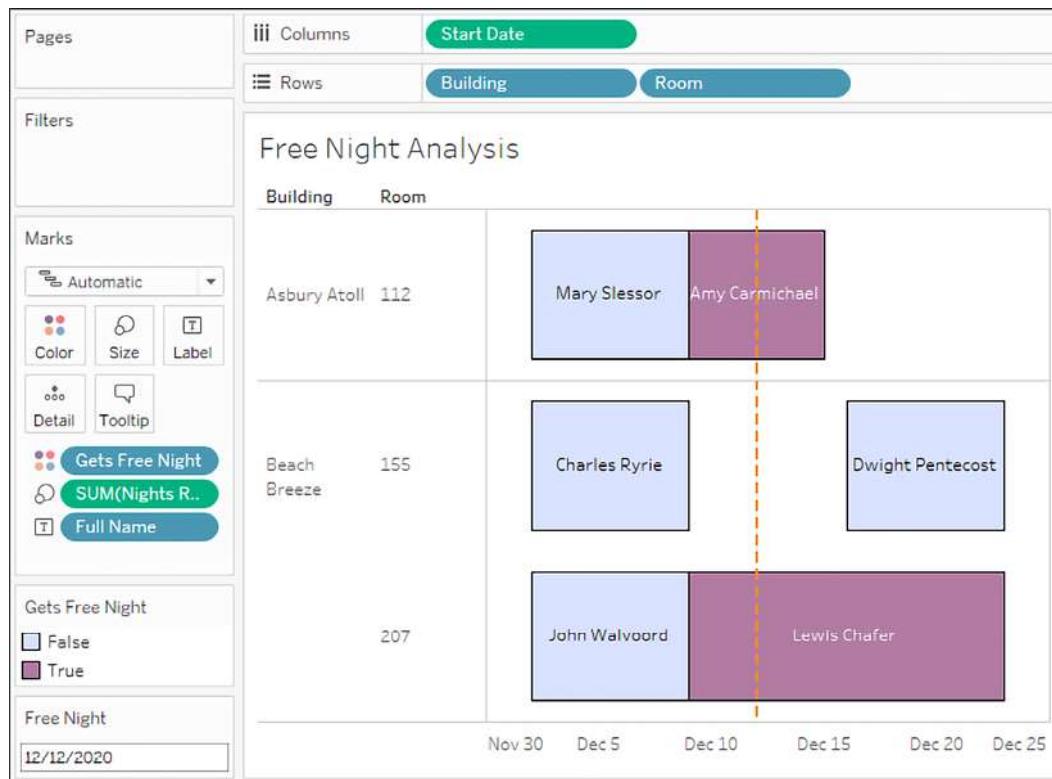

Figure 4.20: The reference line will move, and the affected individuals will be recalculated every time you change the Free Night parameter value

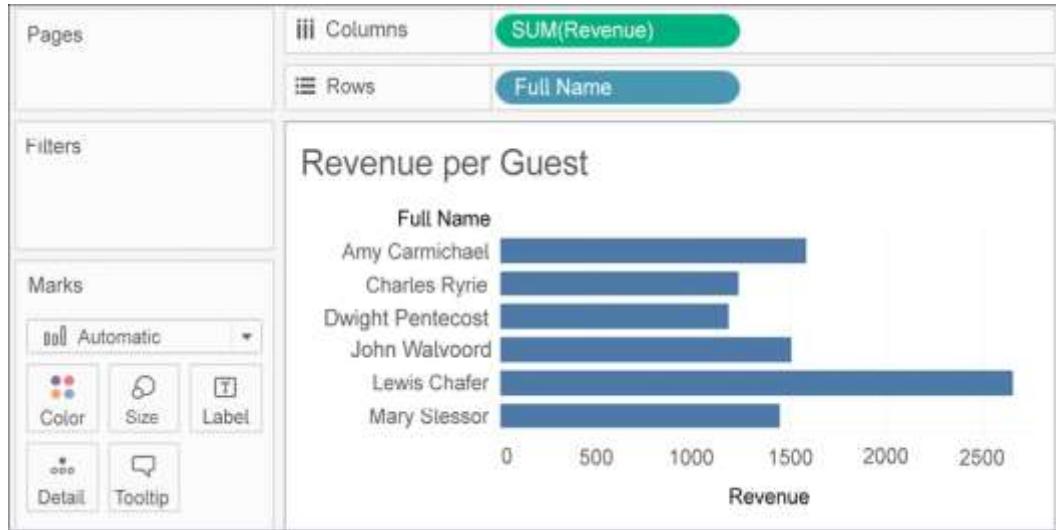

Figure 4.21: The revenue generated from each individual's stay

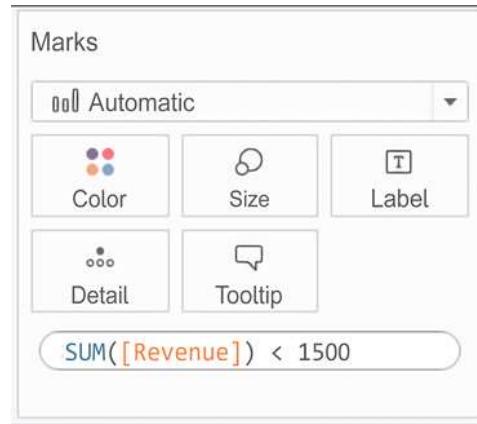

Figure 4.22: Creating an ad hoc calculation on the Marks card

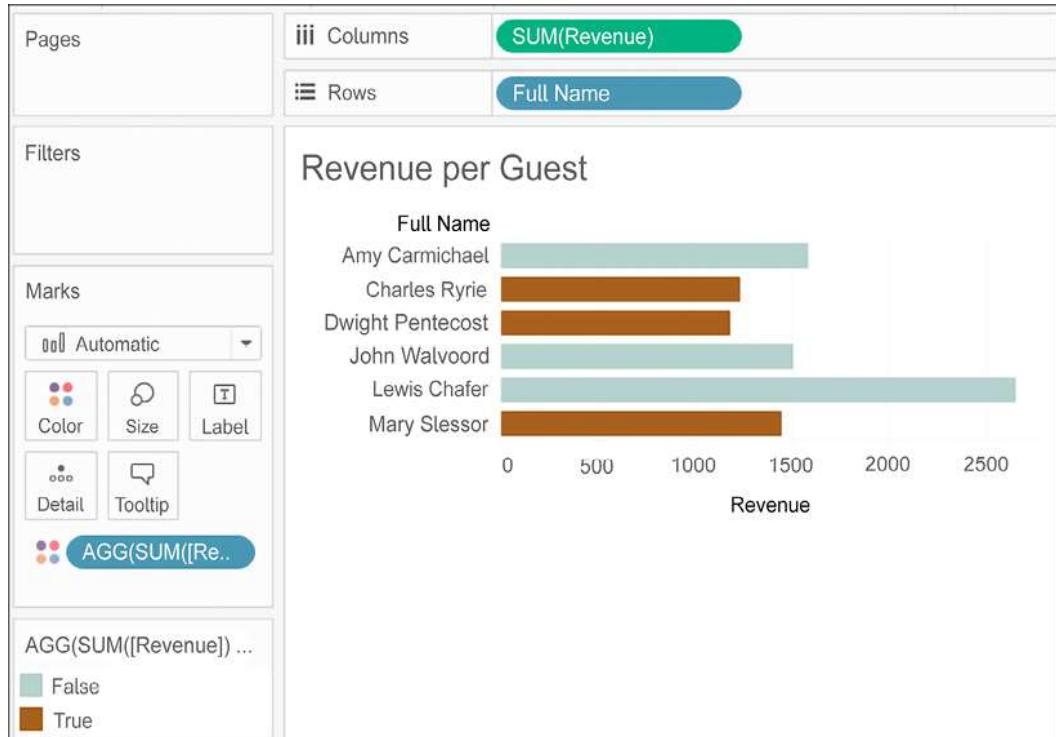

Figure 4.23: Using the ad hoc calculation on Color

Tables

Operator/Keyword	Description
AND	Logical and between two Boolean values or statements
OR	Logical or between two Boolean values or statements
NOT	Logical not to negate a Boolean value or statement

IN	A logical expression that tests for the equality of a value against a list of values and returns true if the value matches one of the items in the list
= or ==	Logical equals to test the equality of two statements or values (single or double equal signs are equivalent in Tableau's syntax)
+	Addition of numeric or date values or the concatenation of strings
-	Subtraction of numeric or date values
*	Multiplication of numeric values
/	Division of numeric values
^	Raise to a power with numeric values
()	Parentheses to define the order of operations or enclose function arguments
[]	Square brackets to enclose field names
{ }	Curly braces to enclose the level of detail calculations
//	Double slash to start a comment

Table 4.1 – Additional functions and operators

Rental Property	First	Last	Start	End	Discount	Rent	Tax per Night
112-Asbury Atoll	Mary	Slessor	Dec 2	Dec 9	150	1,500	15
112-Asbury Atoll	Amy	Carmichael	Dec 9	Dec 15	0	1,500	15
155-Beach Breeze	Charles	Ryrie	Dec 2	Dec 9	260	1,300	10
155-Beach Breeze	Dwight	Pentecost	Dec 16	Dec 23	280	1,400	10
207-Beach Breeze	Lewis	Chafer	Dec 9	Dec 23	280	2,800	10
207-Beach Breeze	John	Walvoord	Dec 2	Dec 9	60	1,500	10

Table 4.2 – Sample dataset for examples

Code

Code 4.1 – Concatenating strings

```
[First] + " " + [Last]
```

Code 4.2 – String manipulation and conditional logic

Name the first Room, and add the following code:

```
SPLIT([Rental Property], "-", 1)
```

Then, create another calculated field named Building with the following code:

```
SPLIT([Rental Property], "-", 2)
```

Code 4.3 – Row-level calculation

```
IF LEFT([Room], 1) = "1"  
THEN "First Floor"  
ELSEIF LEFT([Room], 1) = "2"  
THEN "Second Floor"  
END
```

Code 4.4 – Planning data variations

```
LEFT([Room], 1)
```

Code 4.5 – Planning data variations, additional cases

```
MID([Room], 0, LEN([Room]) - 2)
```

Code 4.6 – % discount

```
SUM([Discount]) / SUM([Rent])
```

Code 4.7 –

```
[Discount] / [Rent]
```

Code 4.8 – To get the start date

```
DATE([Start] + ", 2020")
```

Code 4.9 – To get the end date

```
DATE([End] + ", 2020")
```

Code 4.10 – Create a calculated field named Nights Rented with the following code:

```
DATEDIFF('day', [Start Date], [End Date])
```

Code 4.11 – Create a calculated field called Gets free night

```
[Free Night] >= [Start Date]  
AND  
[Free Night] <= [End Date]
```

Code 4.12 – Analyzing Total Revenue

```
[Rent] - [Discount] + ([Tax per Night] * [Nights Rented])
```

Code 4.13 – Simplifying the code

```
//This is potentially less efficient...  
IF [Type] = "Dog" AND [Age] < 1 THEN "Puppy"  
ELSEIF [Type] = "Cat" AND [Age] < 1 THEN "Kitten"  
END  
//...than this code:  
IF [Age] < 1 THEN  
    IF [Type] = "Dog" THEN "Puppy"  
    ELSEIF [Type] = "Cat" THEN "Kitten"
```

```
END  
END
```

				6/1/2020	17,479
				7/1/2020	17,087
				8/1/2020	16,691
16070	Gerald Quinney	1	1st Mortgage	3/1/2020	144,138
				4/1/2020	140,943
				5/1/2020	137,737
				6/1/2020	134,520
				7/1/2020	131,293
			2	3/1/2020	6,809
				4/1/2020	6,636
				5/1/2020	6,460
				6/1/2020	6,285
				7/1/2020	6,107
				8/1/2020	5,929
				9/1/2020	5,749

Figure 5.8: The data for three selected members in the Loans data set

FIXED Example 2: Most Recent Balance

Member ID	Member Name	Loan Number	Loan Type	Date	Latest Date per Member/Loan
14827	Kelly Wooldridge	1	New Auto Plus	1/1/2020	False
				2/1/2020	False
				3/1/2020	False
				4/1/2020	False
				5/1/2020	False
				6/1/2020	False
				7/1/2020	True
16024	Joseph Clark	1	Used Auto	2/1/2020	False
				3/1/2020	False
				4/1/2020	False
				5/1/2020	False
				6/1/2020	False
				7/1/2020	False
				8/1/2020	True
16070	Gerald Quinney	1	1st Mortgage	3/1/2020	False
				4/1/2020	False
				5/1/2020	False
				6/1/2020	False
				7/1/2020	True
	2	Used Auto	Used Auto	3/1/2020	False
				4/1/2020	False
				5/1/2020	False
				6/1/2020	False
				7/1/2020	False

Figure 5.9: The latest date per loan per person is indicated by a True value for the calculation

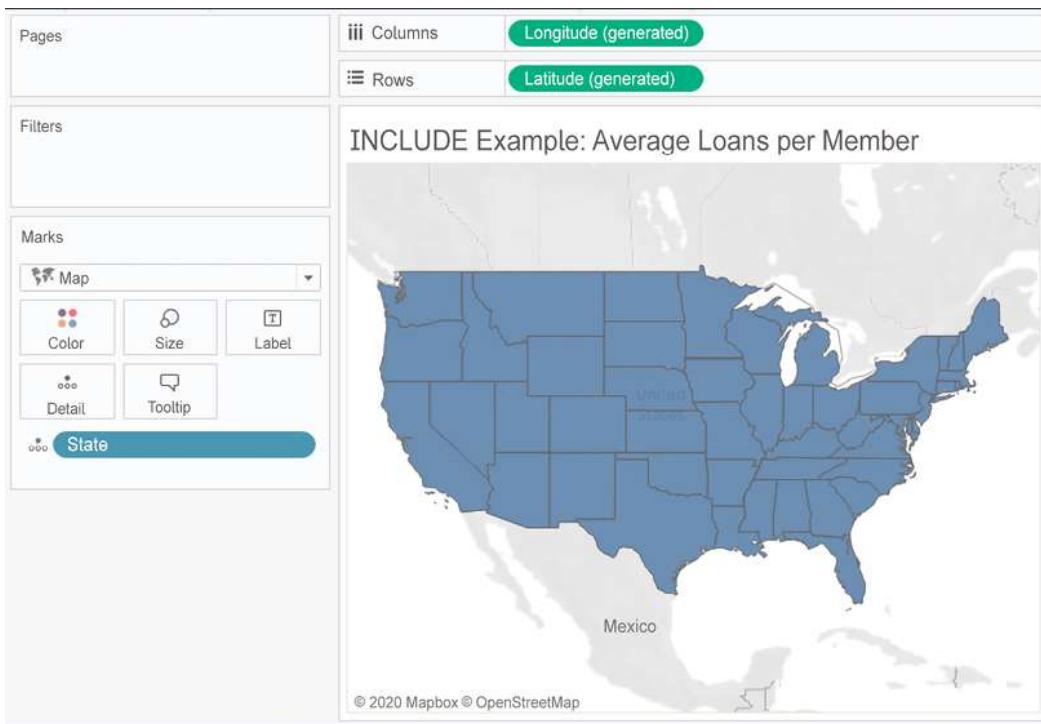

Figure 5.10: The starting place for the example—a filled map by state

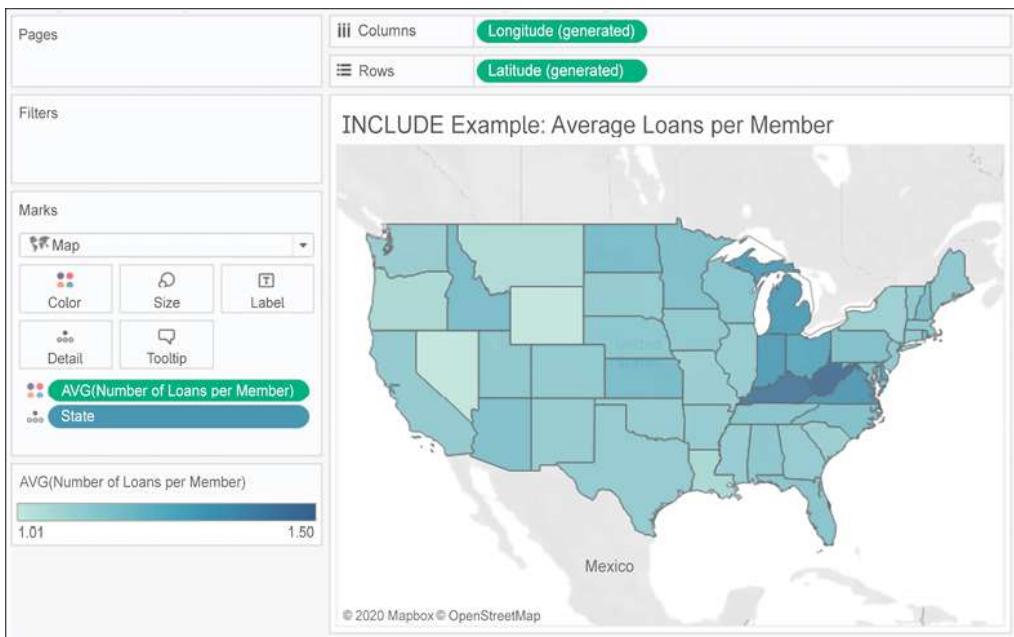

Figure 5.11: Using the include level of detail calculation to create a gradient of color to show average loans per member

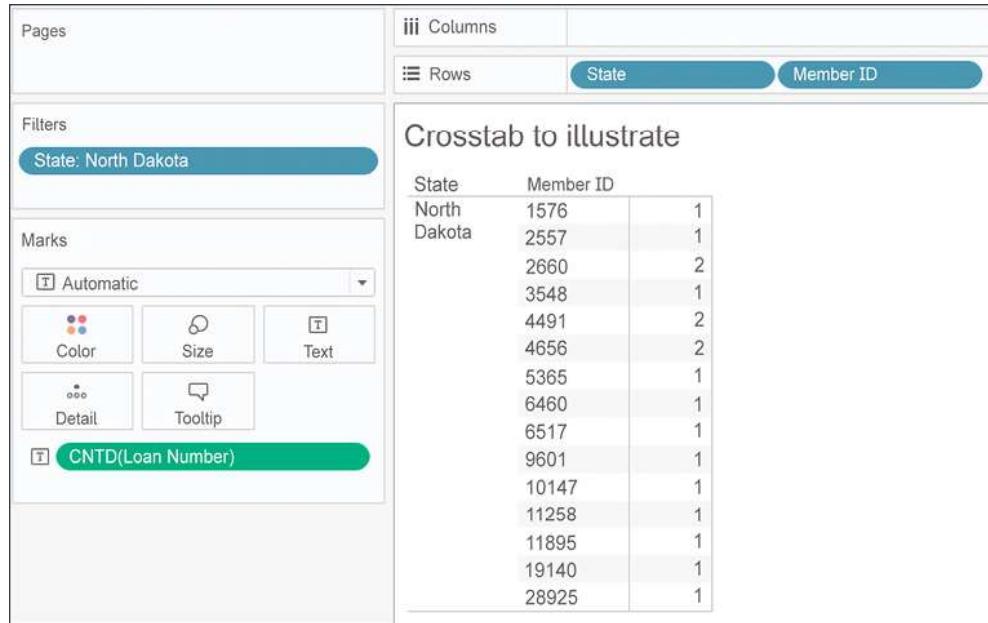

Figure 5.12: A crosstab helps illustrate how the distinct count of loans can be used as a basis for an average

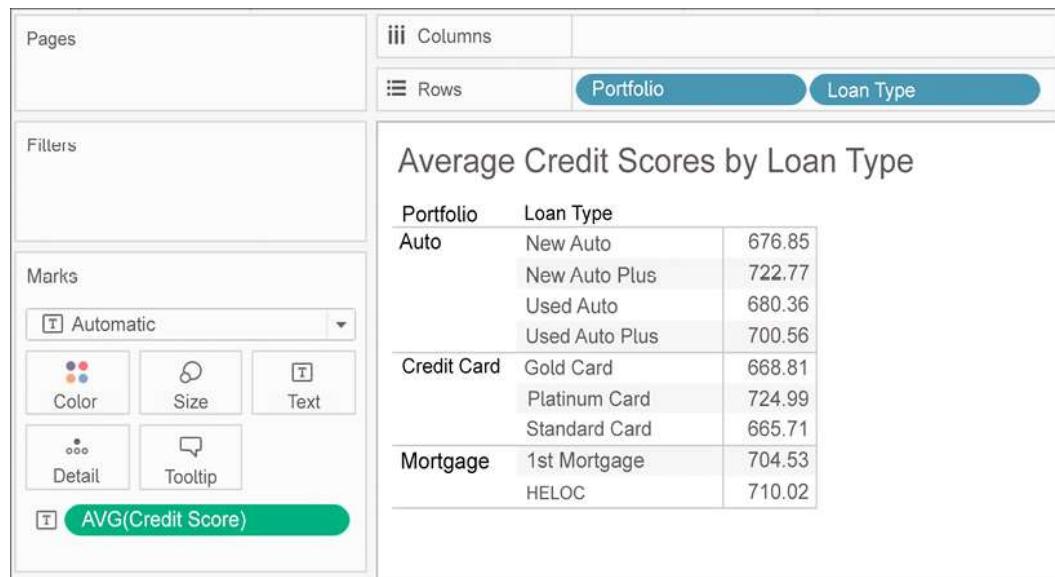

Figure 5.13: This crosstab shows the average credit score per loan type

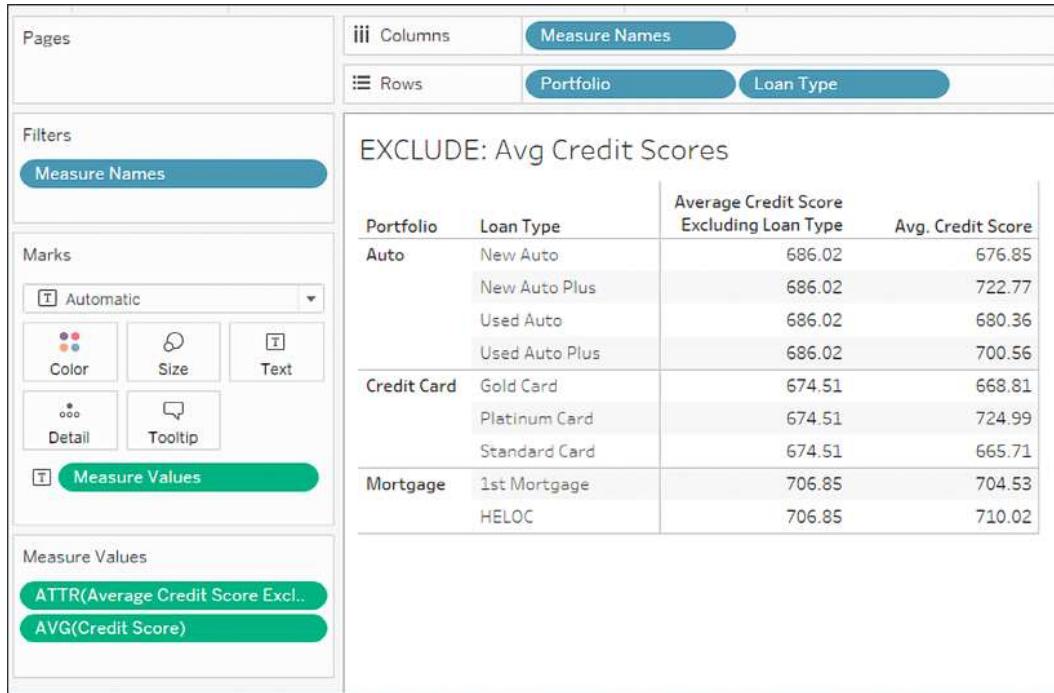

Figure 5.14: The exclude level of detail expression removes Loan Type so the average is only at the portfolio level

Figure 5.15: The final view shows the difference between the loan type average credit score and the overall portfolio average

Code

Code 5.1 – Basic pattern of level of detail syntax

```
{fixed|include|exclude [Dim 1], [Dim 2] : AGG([Field])}
```

Code 5.2 – Minimum number of order per state:

```
{fixed [State] : MIN([Orders])}
```

Code 5.3 – Fixed level of detail expressions

- {fixed [State] : AVG([Orders])}
- {fixed : AVG([Orders])}
- {AVG([Orders])}

Code 5.4 – Calculation named Overall Average Number of Orders and using a fixed level of detail calculation

```
{fixed : AVG([Orders])}
```

Code 5.4 – Fixed level of detail calculation called Latest Date per Member/Loan with code such as this:

```
{fixed [Member ID], [Loan Number] : MAX([Date])} = [Date]
```

Code 5.5 – Level of detail expression named Number of Loans per Member:

```
{include [Member ID] : COUNTD([Loan Number])}
```

Code 5.6

```
COUNTD(STR([Member ID]) + "_" + STR([Loan Number]))  
/  
COUNTD([Member ID])
```

Code 5.7

```
{fixed [State], [Member ID] : COUNTD([Loan Number])}
```

Code 5.8

```
{exclude [Loan Type] : AVG([Credit Score])}
```

Code 5.9

```
AVG([Credit Score]) - AVG([Average Credit Score Excluding  
Loan Type])
```

Chapter 6

Figures

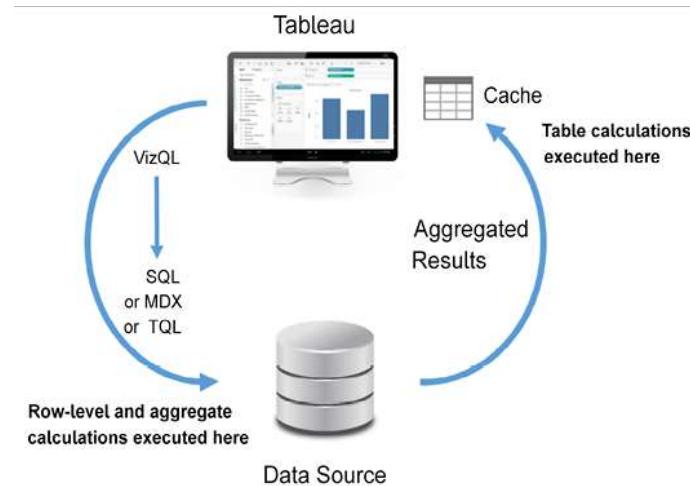

Figure 6.1: Table calculations are computed in Tableau's cache of aggregated data

SUM(Sales)

Figure 6.2: An active field without a table calculation applied

SUM(Sales) △

Figure 6.3: An active field with a table calculation applied includes the delta symbol

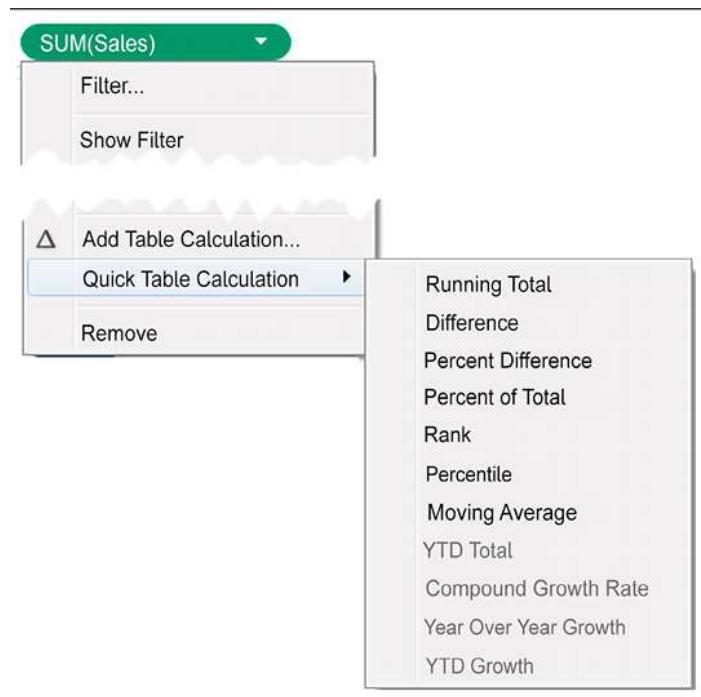

Figure 6.4: Using the dropdown, you can create a quick table calculation from an aggregate field in the view

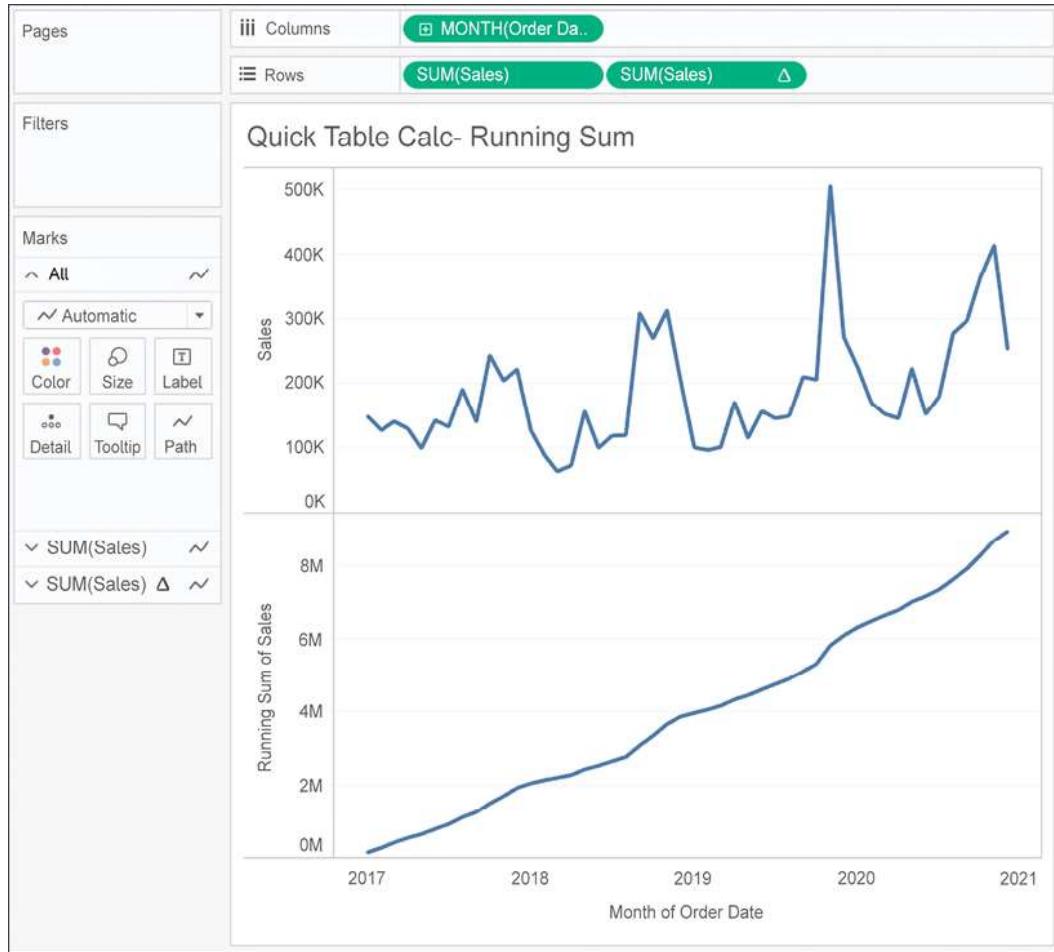

Figure 6.5: The first SUM(Sales) field is a normal aggregate. The second has a quick table calculation of Running Total applied

Some examples of Quick Table Calcs

Year of Order Date	Quarter of Order Date	Sales	Running Sum of Sales along Table	Difference in Sales from the Previous (Down) along Table (Down)	Rank of Sales along Table (Down)
2017	Q1	417,555	417,555		12
	Q2	372,289	789,844	-45,266	13
	Q3	464,319	1,254,163	92,030	10
	Q4	670,182	1,924,345	205,863	5
2018	Q1	279,148	2,203,493	-391,034	16
	Q2	330,269	2,533,762	51,121	14
	Q3	546,875	3,080,637	216,506	7
	Q4	788,255	3,868,892	241,380	3
2019	Q1	298,848	4,167,740	-489,407	15
	Q2	443,764	4,611,504	144,916	11
	Q3	505,453	5,116,957	61,689	9
	Q4	982,675	6,099,632	477,222	2
2020	Q1	547,656	6,647,288	-435,019	6
	Q2	521,650	7,168,938	-26,006	8
	Q3	752,933	7,921,871	231,283	4
	Q4	1,030,156	8,952,027	277,223	1

Figure 6.6: Sales in the first column is simply the SUM(Sales). The three additional columns show various table calculations applied (Running Sum, Difference, Rank)

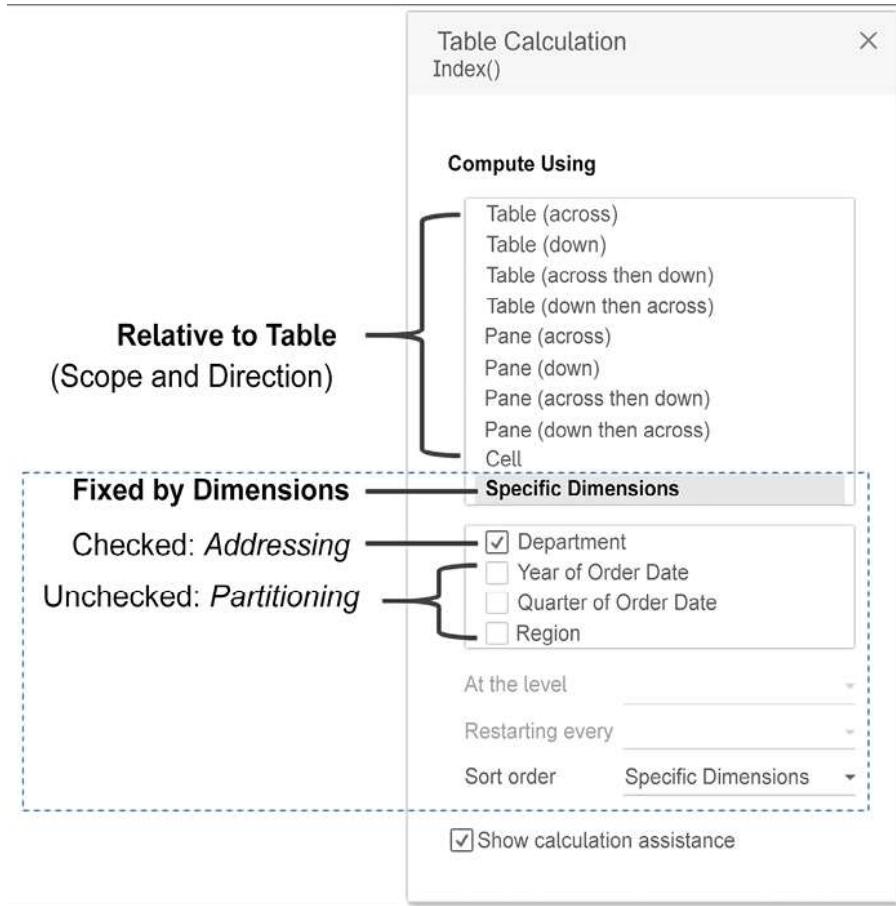

Figure 6.7: The Edit Table Calculation UI demonstrates the difference between Relative and Fixed table calculations

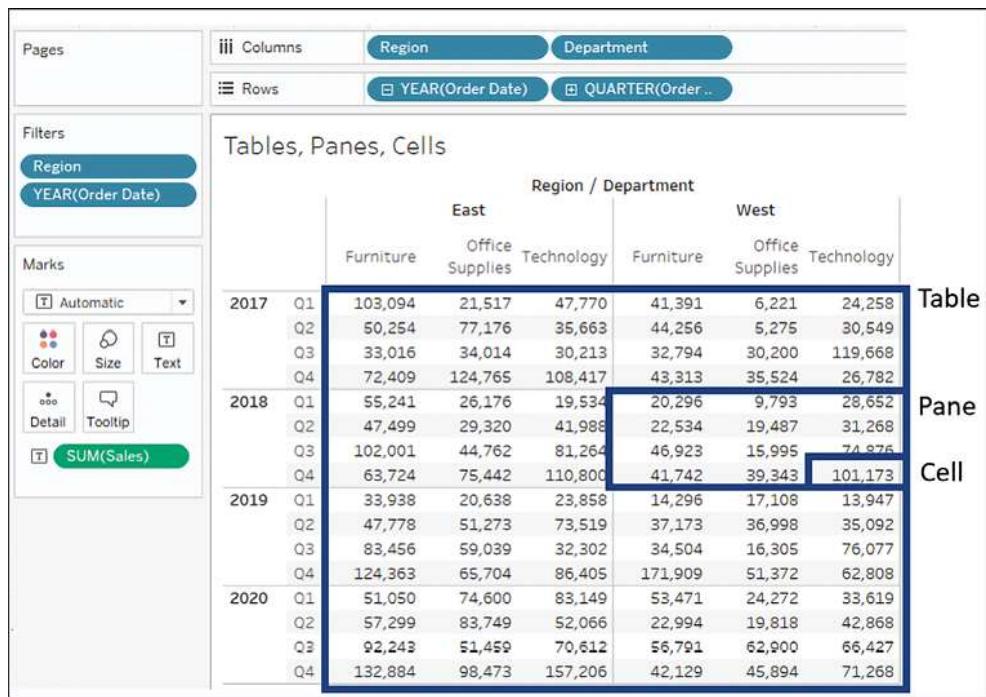

Figure 6.8: The difference between table, pane, and cell in the view

The screenshot shows a large data grid spanning multiple panes. A horizontal blue arrow at the top indicates the data spans across multiple panes. The data grid has the following structure:

		East			West		
		Furniture	Office Supplies	Technolo.	Office Supplies		
					Furniture	Office Supplies	Technolo.
2015	Q1	1	2	3	4	5	6

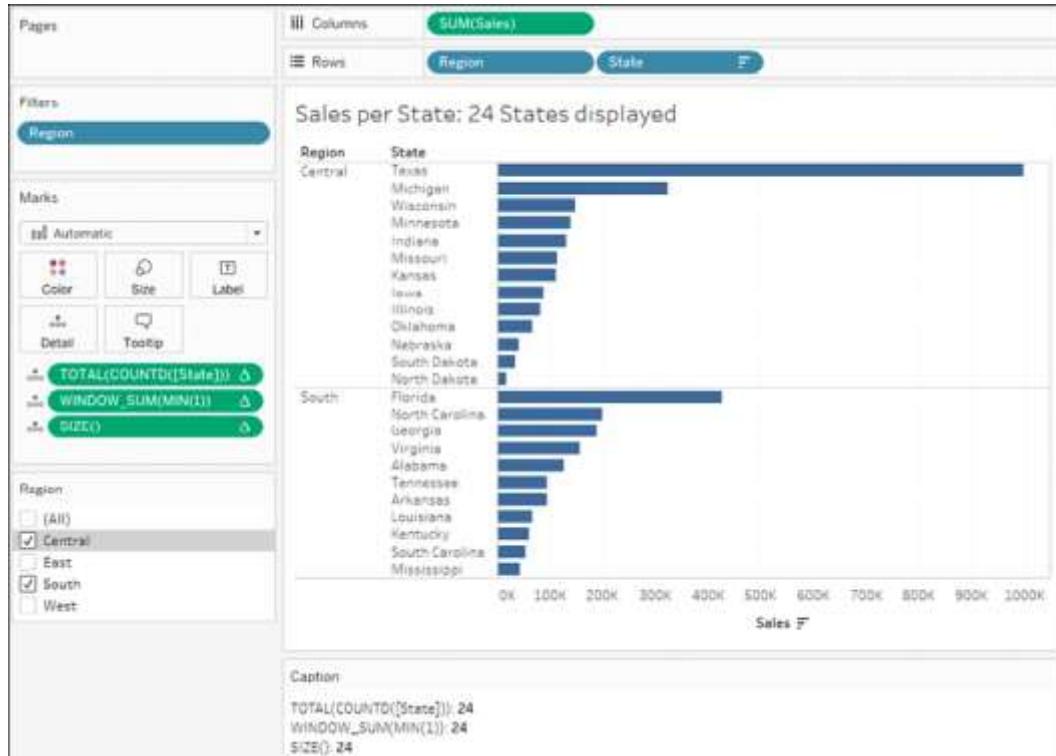

Figure 6.28: Various table calculations could be employed to achieve the total in the title

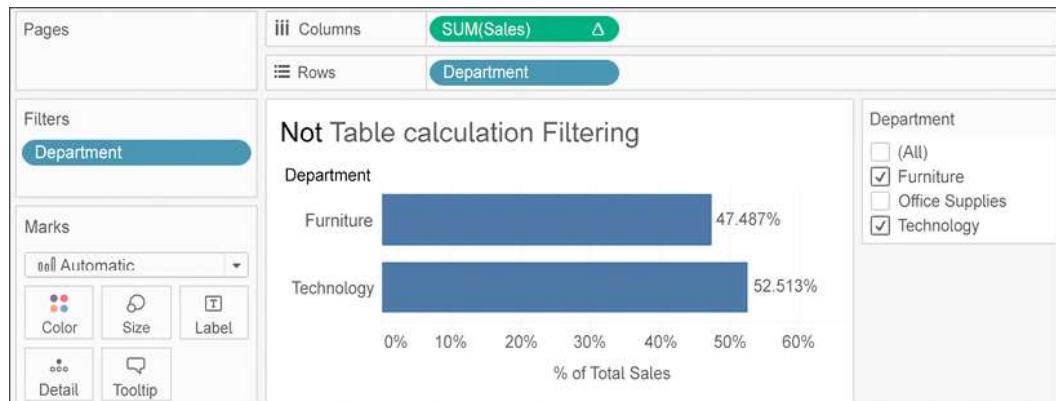

Figure 6.29: When Office Supplies is filtered out, the percentage table calculation adds up to 100% for the departments remaining in the view

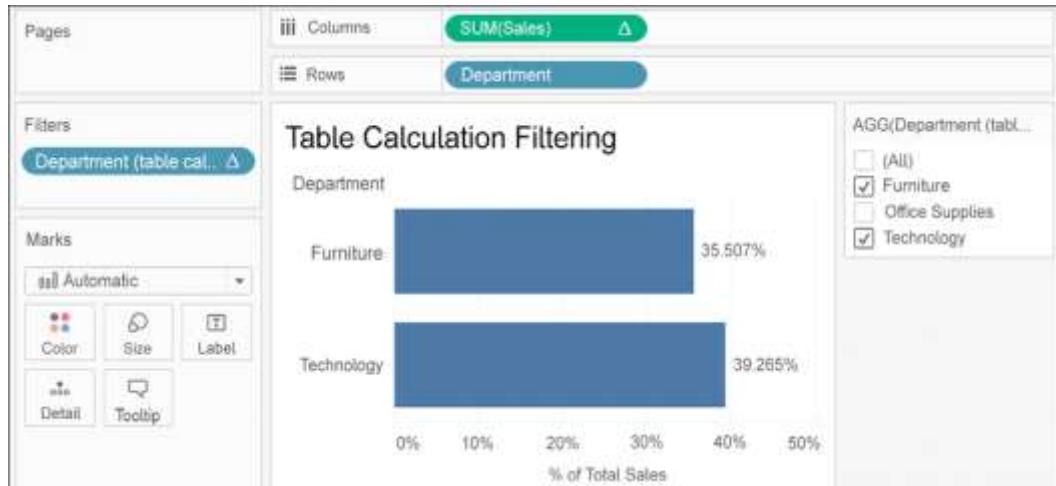

Figure 6.30: When a table calculation filter is used, all the aggregate data is available in the cache for the % of Total Sales to be calculated for all departments

Code

Code 6.1

```
Lookup(ATTR([Category]), -1)
```

Code 6.2

```
Previous_Value("") + "," + ATTR([Category])
```

Code 6.3

```
IF LEN(Previous_Value("")) == 0
THEN ATTR([Category])
ELSE Previous_Value("") + "," + ATTR([Category])
END
```

Code 6.4

```
Running_Sum(SUM([Sales]))
```

Code 6.5

```
Running_Min(SUM([Sales]))
```

Code 6.6

```
Window_Sum(SUM([Sales]))
```

Code 6.7

```
Window_Max(SUM([Sales]))
```

Code 6.8 – Example of Total function

For example, `Total(SUM([Sales]))` gives the same result as `Window_Sum(SUM([Sales]))`, but `Total(AVG([Sales]))` will almost certainly give a different result from `Window_AVG(SUM([Sales]))` because Total is giving you the actual average of underlying rows, while the Window function is averaging the sums

Code 6.9

```
LOOKUP(ATTR([Department]), 0)
```

Links

For a more comprehensive discussion of Marimekko charts, along with approaches that work with sparse data, see Jonathan Drummond's blog post at

<https://www.tableau.com/about/blog/2016/8/how-build-marimekko-chart-tableau-58153>.

Code

Code 10.1 – Building Sparklines

Creating two calculated fields to show the minimum and maximum quarterly sales values for each category.

Min Sales:

```
WINDOW_MIN(SUM(Sales))
```

Max Sales:

```
WINDOW_MAX(SUM(Sales)). Add both to Rows as discrete (blue) fields.
```

Place the Last Sales calculation with the following code:

```
IF LAST() == 0 THEN SUM([Sales]) END
```

Code 10.2 – Creating symbol charts

The view is filtered where **Late Shipping** is True. **Late Shipping** is a calculated field that determines if it took more than 14 days to ship an order. The code is as follows:

```
DATEDIFF('day', [Order Date], [Ship Date]) > 14
```

Code 10.3 – Marimekko Charts

The calculated field **Sales for Region** calculates the x axis location for the right-side position of each bar. See code 10.3.

```
IF FIRST() = 0
    THEN MIN({EXCLUDE [Department] : SUM(Sales)})
ELSEIF LOOKUP(MIN([Region]), -1) <> MIN([Region])
    THEN PREVIOUS_VALUE(0) + MIN({EXCLUDE [Department] : SUM(Sales)})
ELSE
    PREVIOUS_VALUE(0)
END
```

Finally, a few additional adjustments were made to the view: the field on **Size** is an ad hoc level of detail calculation with the code:

```
{EXCLUDE [Department] : SUM(Sales)}
```

Links

- The details map visualizations are outside the scope of this book; however, you'll find excellent documentation from Tableau at [Tableau's website](#).

https://help.tableau.com/current/pro/desktop/en-us/maps_mapsources_wms.htm.

- To replicate the example in figure 12.8, download the shapefile from the United States Census Bureau here: <https://catalog.data.gov/dataset/tiger-line-shapefile-2015-nation-u-s-rails-national-shapefile>.

Code

Code 12.1 – We'll create a calculation called Hospital Latitude with the following code:

```
{FIXED : MIN(IF [Location Type] == "Hospital" THEN  
[Latitude] END) }
```

Code 12.2 – And a corresponding calculation called Hospital Longitude with the following code:

```
{FIXED : MIN(IF [Location Type] == "Hospital" THEN  
[Longitude] END) }
```

Code 12.3 – MAKELINE() and MAKEPOINT()

Create a calculated field to draw a line between the hospital and each patient. We'll name our calculation Line and write this code:

```
MAKELINE (  
    MAKEPOINT([Hospital Latitude], [Hospital Longitude]),  
    MAKEPOINT([Latitude], [Longitude])  
)
```

Code 12.4 – DISTANCE()

We might create a calculated field named Distance to the Hospital with the following code:

```

DISTANCE (
    MAKEPOINT([Hospital Latitude], [Hospital Longitude]),
    MAKEPOINT([Latitude], [Longitude]),
    'mi'
)

```

Code 12.5 – BUFFER()

we'll create a calculated field named Hospital Radius, with the following code:

```

IF [Location Type] == "Hospital"
THEN BUFFER(MAKEPOINT([Latitude], [Longitude]), 3, 'mi')
END

```

Add an Extension

←

 **Image Map Filter**
by Tableau
 Sandboxed | Free

Add to Dashboard

Description

Instead of boring old filters add a new level of interactivity with clickable image maps. Simply select your image, draw hot spots and filter away. From floor maps to product schematics, you can now easily create deeper interactivity without dealing with polygons and points. This extension, code-named Jungle Book, was inspired by the daughters of one of our developers and has been a favorite to demo over the past couple of years. It is now an official Tableau extension that everyone can use and enjoy. Try out the demo [here](#). Check out the [GitHub repository](#) for the source code and set-up instructions or to report an issue.

Prior to the extension working, you will need to make sure all necessary tools (such as the Tableau Extensions API SDK) are installed, your environment is configured, and the extension is pointing to the ShowImage.trex file based on your local directory structure.

The screenshot shows the 'Edit Field Attributes' interface for the 'titanic.training' dataset. On the left, there's a sidebar with a search bar and a list of fields: Ticket, Cabin, Class, Fare, Embarked, Destination, Name, Age, and Sex. The 'Class' field is highlighted. In the center, there's a preview table with columns for Ticket, Cabin, and Class. The 'Class' column is highlighted in green. On the right, there's a detailed view of the 'Class' field with sections for Field Label (containing 'Class'), Field Type (set to 'Dimension'), and other attributes. At the bottom, there are 'Back' and 'Upload File' buttons.

Tags of the Manifest File

First, notice the description and author tags:

```
<description>Show Image Based on Parameters</description>
<author name="Joshua N. Milligan"
email="jmilligan@teknionusa.com" organization="VizPainter"
website="https://www.vizpainter.com"/>
```

Next, consider the source-location tag:

```
<source-location>
<url>http://localhost:8765/Samples>ShowImage>ShowImage.html
</url>
</source-location>
```

Code

Code 13.1 – The HTML file

The most important snippets:

```
<script
src="../../lib/tableau.extensions.1.latest.js"></script>
```

This reference points to the latest version of the Extensions API. Assuming you configured and started the web server based on the location of your Tableau Extensions API download, your reference should not need to be altered.

Next, we have a reference to the JavaScript file we'll use for our code:

```
<script src=".>ShowImage.js"></script>
```

This line references the ShowImage.js file that contains all the code we'll need to update the image based on parameter values in the dashboard.

Finally, within the body of the HTML, there is one final tag:

```
<img id="imgImage" src=' '/>
```

This defines the image and initializes it with a blank source. We'll update this object in the JavaScript code based on parameter values in the dashboard.

Code 13.2 – The JavaScript file

First, we have a function to update the image based on the parameter values:

```
function updateImage (p) {  
    if (p.name=='ImageURL') {  
        document.getElementById("imgImage").src =  
p.currentValue.formattedValue;  
    }  
    else if (p.name=='ImageWidth') {  
        document.getElementById("imgImage").style.width =  
p.currentValue.formattedValue + "px";  
    }  
}
```

This function takes in a parameter object, p, and then checks the name of the object. If the parameter's name is ImageURL, then it sets the src attribute of the HTML image to the value of the parameter. If the parameter's name is ImageWidth, then it sets the width style to the parameter value with "px" (pixels) appended.

This example highlights the fact that many extensions will require certain naming conventions to be used in a dashboard. Specifically, this extension requires a parameter named ImageURL to set the URL for the image. The extension will function without a second parameter named ImageWidth, but only a parameter with that exact name can be used to set the image width.

Next, we have a function that is called whenever a parameter value changes:

```
function onParameterChange (parameterChangeEvent) {  
    parameterChangeEvent.getParameterAsync().then(function  
(param) {  
        updateImage(param);  
    });  
}
```

We'll see next how the the onParameterChange function is set as an event listener. For now, understand that the function is called whenever a value of a parameter changes in

the dashboard. When a parameter's value changes, the previously examined updateImage function is called with the changed parameter as an argument.

Finally, notice the document.ready function, which will be called after the HTML document has loaded, giving us a chance to initialize everything we need:

```
$ (document).ready(function () {
    tableau.extensions.initializeAsync().then(function () {
        tableau.extensions.dashboardContent.dashboard.getParametersAsync().then(function (parameters) {
            parameters.forEach(function (p) {
                p.addEventListener(tableau.TableauEventType.ParameterChanged, onParameterChange);
                updateImage(p);
            });
        });
    });
});
```

When the HTML document is loaded and ready, this block of code will be executed.

First, the Tableau extensions initialization is called, after which tableau.extensions.dashboardContent.dashboard.getParametersAsync() gets an array of all parameters in the dashboard. For each of those parameters, the onParameterChange function is added as an event listener and the updateImage function is called, which will update either the image source or the width depending on which parameter is passed in.

All of these functions work together such that when the extension is first loaded in the dashboard and the image will be updated whenever a parameter value changes .

Code 13.3 – Using a Python script in Tableau

```
SCRIPT_STR(
"
import re
exceptions = ['a', 'an', 'the', 'at', 'by', 'for', 'in',
'of', 'on', 'to', 'up', 'and', 'as', 'but', 'or', 'nor',
'with', 'is']
if _arg1 is None:
```

```
    return None
title = _arg1[0]
word_list = re.split(' ', title.lower())
capitalized_title = [word_list[0].capitalize()]
for word in word_list[1:]:
    capitalized_title.append(word if word in exceptions else
word.capitalize())
return ' '.join(capitalized_title)
",
MIN([Title]) )
```

Code 13.4

```
SCRIPT_REAL('{  
"modelOrPredictionDefinitionId": "10R8c000000L1hcGAC",  
"columns": ["Class", "Sex"]  
}', ATTR([Class]), ATTR([Sex]))
```

Command

The basic commands to set up TabPy are:

To install pip, a package installer for Python, issue this command:

```
python -m pip install --upgrade pip
```

To install TabPy, issue this command:

```
pip install tabpy
```

To run TabPy, issue this command:

```
tabpy
```

The screenshot shows the Power BI Data Model view. On the left, there is a navigation pane with a tree structure. The main area displays the 'Hospital Visit' table. The table has three columns: 'Admit Type', 'Location', and 'Discharge Details ID'. There are five rows of data:

Admit Type	Location	Discharge Details ID
Urgent	ER	111
Urgent	Triage	222
Elective	Lab	333
Emergency	ER	444
Emergency	ER	555

On the left side of the table, there are relationship tools. It shows 'Hospital V...' is related to 'Patient' via a many-to-many relationship. Below this, there are dropdown menus for 'Patient' and 'Oper...' fields, and a button to 'Add more fields'. At the bottom, there is a section for 'Performance Options'.

	Nov	\$0	750
	Dec	\$0	750

Figure 15.20: The Apartment Rent data, which is poorly structured because the Square Feet measure is repeated for every month

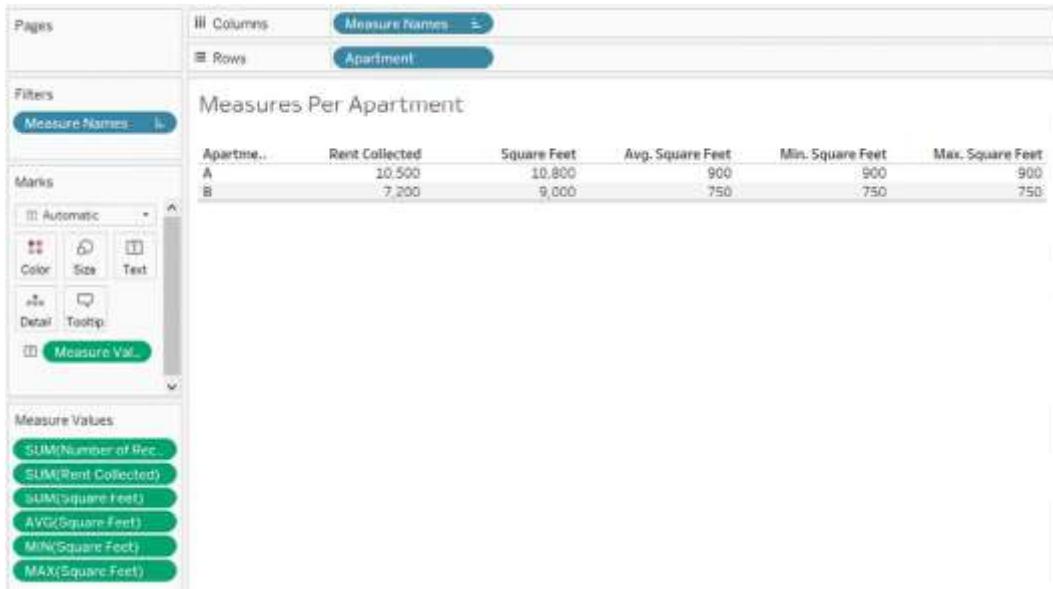

Figure 15.21: An illustration of how various aggregations might be right or wrong depending on the level of detail

Apartment	Rent Collected	Sum of Square Feet	Avg. Square Feet	Min. Square Feet	Max. Square Feet
A	\$10,500	10,800	900	900	900
B	\$7,200	9,000	750	750	750
Grand Total	\$17,700	19,800	825	750	900

Figure 15.22: None of the aggregations work to give us a grand total

Apartment	Rent Collected	Square Feet per Apartment
A	\$10,500	900
B	\$7,200	750
Grand Total	\$17,700	1,650

Figure 15.23: An LOD calculation gives us the correct result at all levels of detail

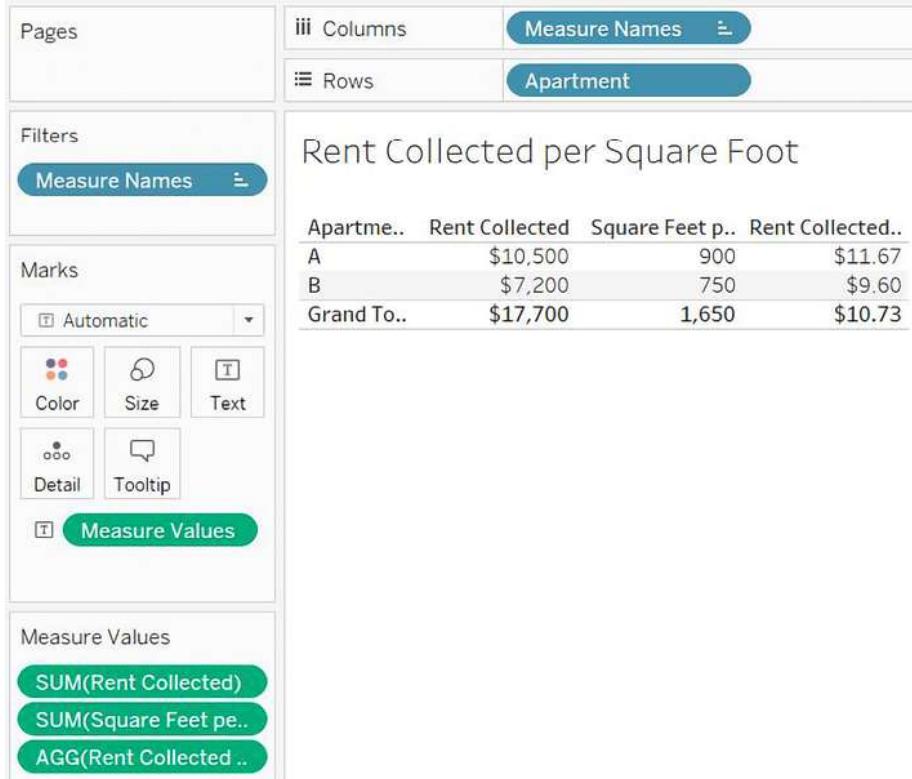

Figure 15.24: The LOD expression gives us the foundation for even more complexity, such as calculating the rent per area

Example of Unions

Table 15.1 – Originals:

Name	Occupation	Bank account balance
Luke	Farmer	\$2,000
Leia	Princess	\$50,000
Han	Smuggler	-\$20,000

Table 15.1 – Prequals:

Name	Occupation	Bank account balance
Watto	Junk Dealer	\$9,000
Darth Maul	Face Painter	\$10,000
Jar Jar	Sith Lord	-\$100,000

Table 15.1 – Sequels:

Name	Occupation	Bank account balance
Rey	Scavenger	\$600
Poe	Pilot	\$30,000
Kylo	Unemployed	\$0

Table 15.1 – A union of these tables would give a single table containing the rows of each individual table:

Name	Occupation	Bank account balance
Luke	Farmer	\$2,000
Leia	Princess	\$50,000
Han	Smuggler	-\$20,000
Watto	Junk Dealer	\$9,000
Darth Maul	Face Painter	\$10,000
Jar Jar	Sith Lord	-\$100,000
Rey	Scavenger	\$600
Poe	Pilot	\$30,000
Kylo	Unemployed	\$0

Code

Code 15.1 – Obtain the date using a calculated field with code such as the following:

```
DATEPARSE('yyyy-MM', [Table Name] )
```

Code 15.2

```
IF [Admit Date] <= [Date] AND [Discharge Date] >= [Date]
THEN 1
```

```
ELSE 0  
END
```

Code 15.3

```
{ INCLUDE [Apartment] : MIN([Square Feet]) }
```

Code 15.4

```
SUM([Rent Collected])/SUM([Square Feet per Apartment])
```

Code 15.5

```
SELECT [Country Name],[1960] AS Population, 1960 AS Year  
FROM Countries  
  
UNION ALL  
  
SELECT [Country Name],[1961] AS Population, 1961 AS Year  
FROM Countries  
  
UNION ALL  
  
SELECT [Country Name],[1962] AS Population, 1962 AS Year  
FROM Countries  
...  
...
```

Chapter 16

Figures

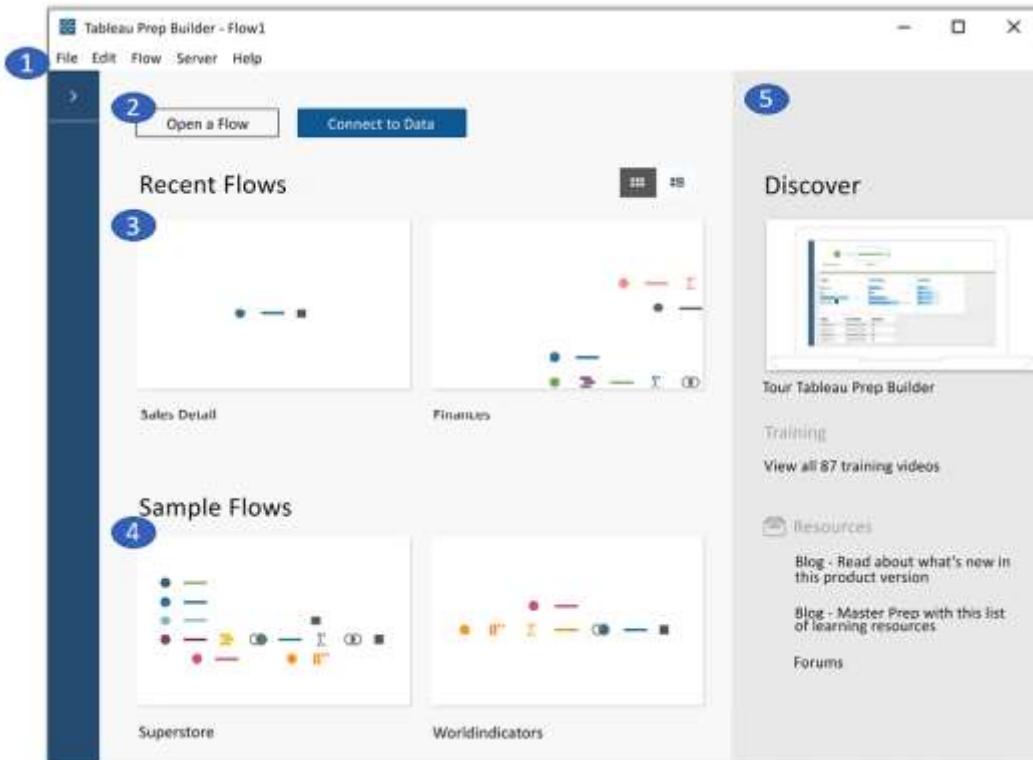

Figure 16.1: The Tableau Prep Builder welcome screen with numbering to identify key components of the UI

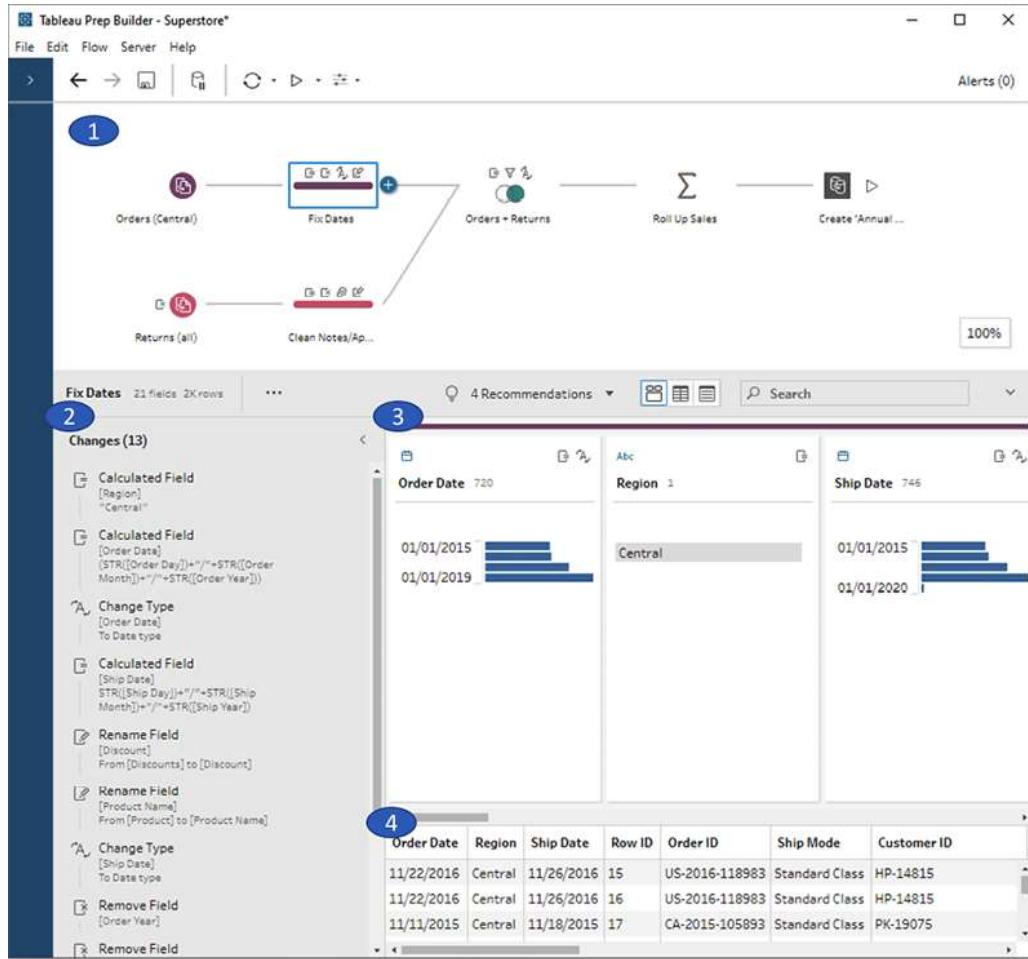

Figure 16.2: When designing a flow, you'll find an interface like this one. The major components are numbered and described as follows

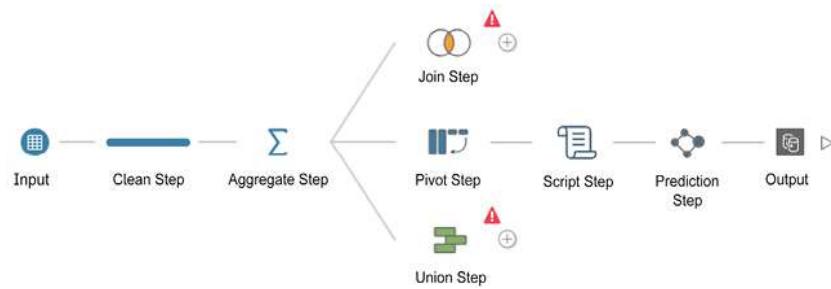

Figure 16.3: An example flow in Tableau Prep

Figure 16.4: You can make a new data connection by clicking the + button or the Connect to Data button

Employee Flights Fields selected: 10 of 10 Filter Values...					
Select the fields to include in your flow, apply a filter, or change data types. To see and clean your data, add a cleaning step in the flow pane.					
<input checked="" type="checkbox"/>	Type	Field Name	Original Field Name	Changes	Sample Values
<input checked="" type="checkbox"/>	#	Employee Airline...	Employee Airline Travel		null
<input checked="" type="checkbox"/>	Abc	F2	F2		null
<input checked="" type="checkbox"/>	Abc	F3	F3		null
<input checked="" type="checkbox"/>	Abc	F4	F4		null, 07/08/1905, 07/09/1905
<input checked="" type="checkbox"/>	Abc	F5	F5		Total Cost, \$100,287.00, \$108,788.00
<input checked="" type="checkbox"/>	Abc	F6	F6		null
<input checked="" type="checkbox"/>	#	F7	F7		null
<input checked="" type="checkbox"/>	Abc	F8	F8		null
<input checked="" type="checkbox"/>	Abc	F9	F9		null
<input checked="" type="checkbox"/>	Abc	F10	F10		null

Figure 16.5: The input preview allows you to select input fields to include in the flow, rename fields, and change data types

The screenshot shows the Microsoft Power BI Data Interpreter interface. At the top, under 'Connections', there is a entry for 'Employee Flights.xlsx' (Microsoft Excel). Below it is a search bar. Under 'Tables', there is a section titled 'Cleaned with Data Interpreter' with a note about undoing changes. Three tables are listed: 'Employee Flights' (selected), 'Employee Flights C3:E7', and 'Employee Flights Table1'. A large blue arrow points downwards from the 'Employee Flights' table entry to the 'Fields selected' table below.

	Type	Field Name	Original Field Name	Changes	Sample Values
<input checked="" type="checkbox"/>	#	Row ID	Row ID		4,144, 9,102, 2,194
<input checked="" type="checkbox"/>	Abc	Passenger Email	Passenger Email		ekiefer@vizpainter.com, abarton@viz
<input checked="" type="checkbox"/>	Abc	Purchase Date	Purchase Date		01/10/2019, 09/10/2017, 10/22/2018
<input checked="" type="checkbox"/>	Abc	Travel Date	Travel Date		02/06/2019, 11/12/2017, 12/17/2018
<input checked="" type="checkbox"/>	Abc	Passenger ID	Passenger ID		EH-14125, AB-10105, AP-10915
<input checked="" type="checkbox"/>	Abc	Airline	Airline		United, American Airlines
<input checked="" type="checkbox"/>	#	Ticket Price	Ticket Price		184, 214, 199

Figure 16.6: The data interpreter parses the file to fix common issues such as merged cells, empty headers, and sub-total lines

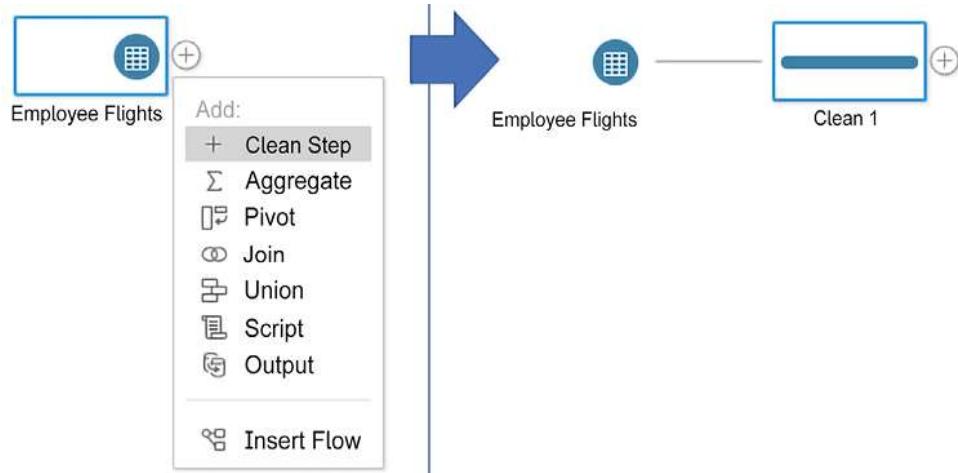

Figure 16.7: Adding a step extends the flow. Here, adding a clean step adds Clean 1

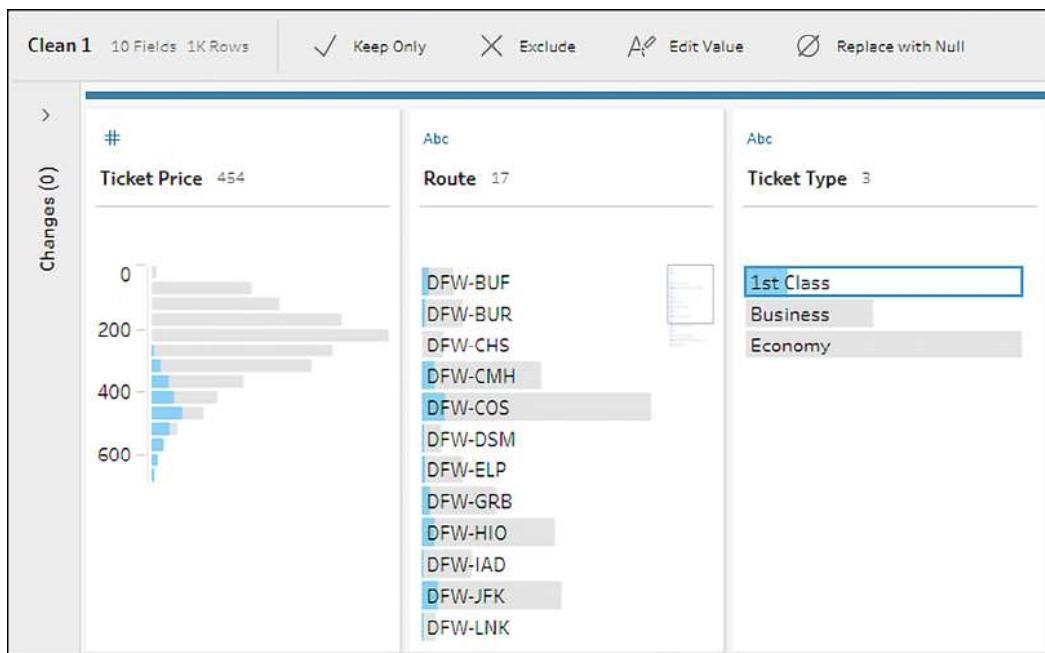

Figure 16.8: Selecting a value for a field in the profile pane highlights which values (and what proportion of those values) relate to the selected value

Southwest 2019 Fields selected: 9 of 9

	Type	Field Name
<input checked="" type="checkbox"/>	Abc	Passenger Email
<input checked="" type="checkbox"/>	T F	Travel Insurance?
<input checked="" type="checkbox"/>	Date	Purchase Date
<input checked="" type="checkbox"/>	Date	Travel Date
<input checked="" type="checkbox"/>	Abc	Fare Type
<input checked="" type="checkbox"/>	#	Ticket Price
<input checked="" type="checkbox"/>	Abc	Route
<input checked="" type="checkbox"/>	#	Row_ID
<input checked="" type="checkbox"/>	Abc	Person

Figure 16.9: A text file includes options for headers, field separators, text qualifiers, character sets, and more. Notice also the tabs such as Multiple Files and Data Sample giving other options for the text input

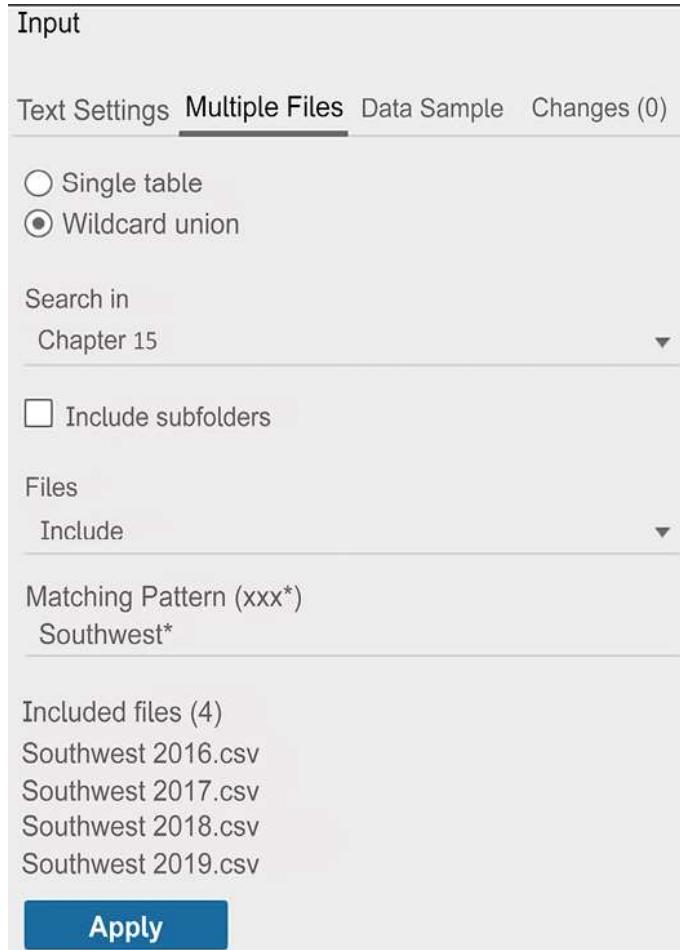

Figure 16.10: Using Matching Pattern tells Tableau Prep which files to union together. That way, when Southwest 2020.txt and future files are dropped into the directory, they will be automatically included

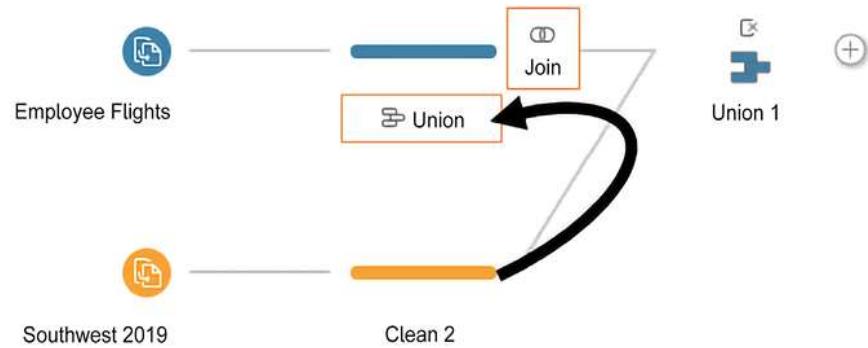

Figure 16.11: Dragging one step onto another in the flow reveals options for bringing the datasets together in the flow. Here, for example, there are options for creating a Union or Join

The screenshot shows the Tableau Prep interface with the following details:

- Step Name:** Union 1 (15 Fields 5K Rows)
- Buttons:** Merge Fields, Settings, Changes (0)
- Inputs:** Clean 1 (blue square), Clean 2 (orange square)
- Resulting Fields:** 8 Mismatching fields from 15 resulting fields.
- Mismatched Fields:**
 - Travel Insurance? (white square, orange square)
 - Fare Type (highlighted with a blue border, white square, orange square)
 - Row_ID (white square, orange square)
 - File Paths (white square, orange square)
 - Row_ID (blue square, white square)
 - Passenger ID (blue square, white square)
 - Airline (blue square, white square)
 - Ticket Type (blue square, white square)

Figure 16.12: When you select a single field, Tableau Prep will highlight fields that are potentially the same data. Selecting both reveals the Merge Fields option

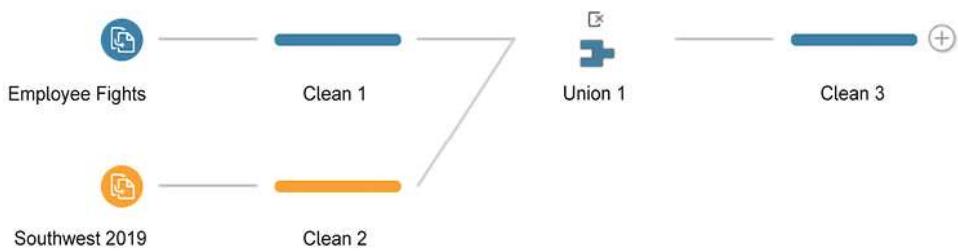

Figure 16.13: Your flow should look similar to this. You may notice some variation in the exact location of steps or color (you can change a step's color by right-clicking a step and selecting Edit Color)

Figure 16.14: Every null value in the Airline field comes from the Southwest files. Fortunately, in this case, the source of the data indicates the airline

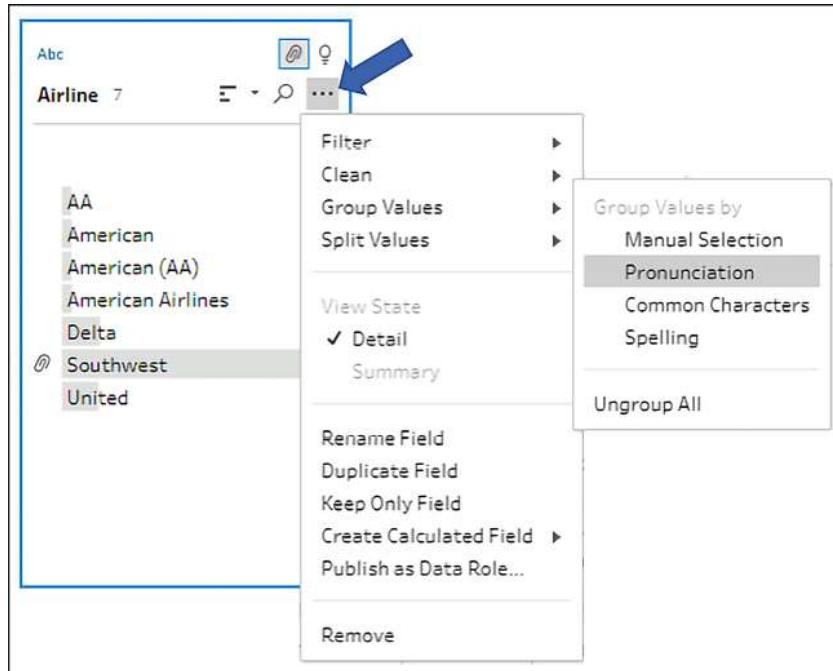

Figure 16.15: The ellipsis button on a field will reveal a plethora of options, from cleaning to filtering, to grouping, to creating calculations

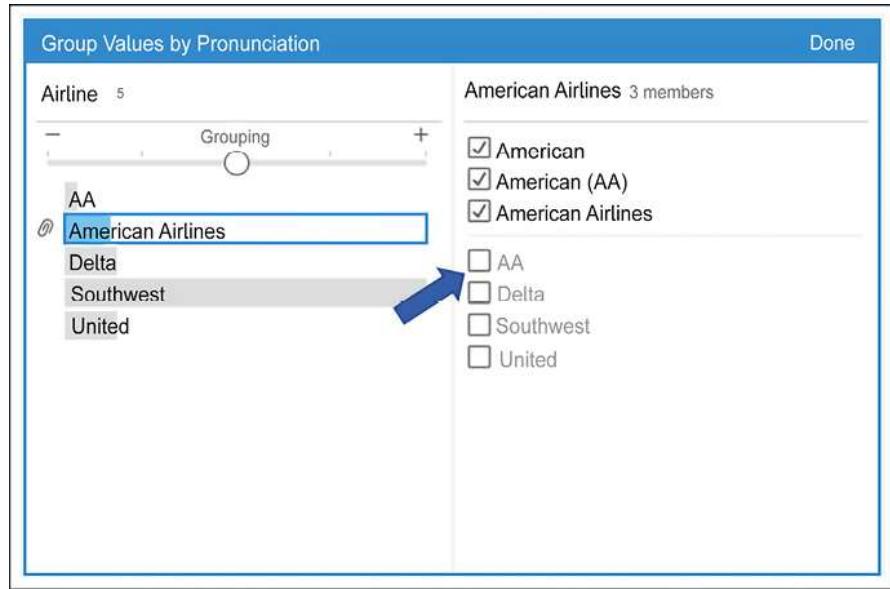

Figure 16.16: When grouping by pronunciation, you'll notice a slider allowing you control over the sensitivity of the grouping. You can also manually adjust groupings by selecting a field

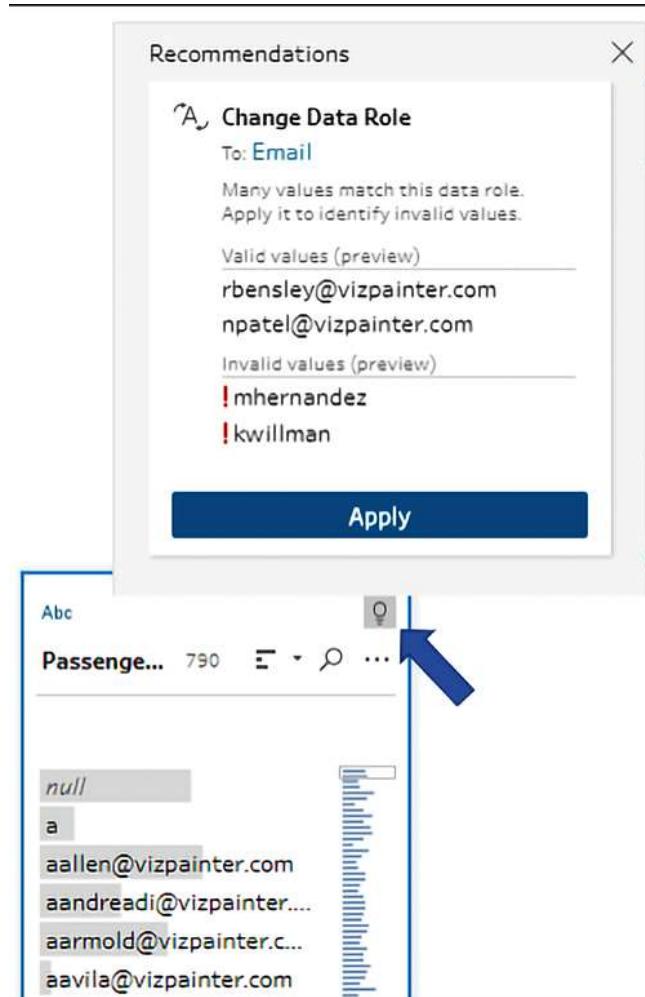

Figure 16.17: Recommendations will show when Tableau Prep has suggestions for cleaning a field

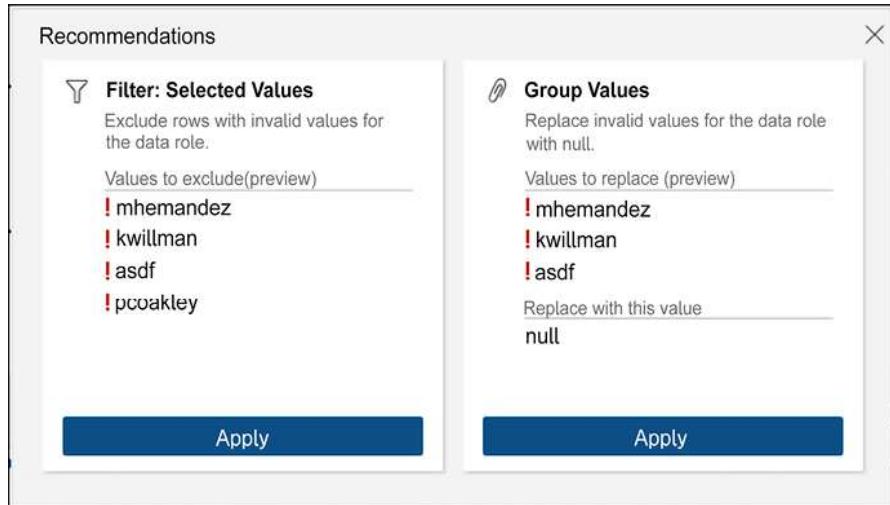

Figure 16.18: Here, Tableau Prep suggests either filtering out records with invalid values or replacing the invalid values with null. In this case, we don't want to filter out the entire record, but the invalid values themselves are useless and are best represented by null

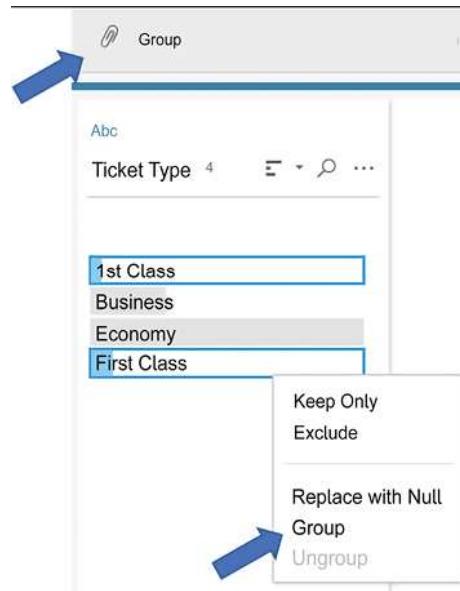

Figure 16.19: After selecting two or more values, you can group them together with the toolbar option or the right-click menu

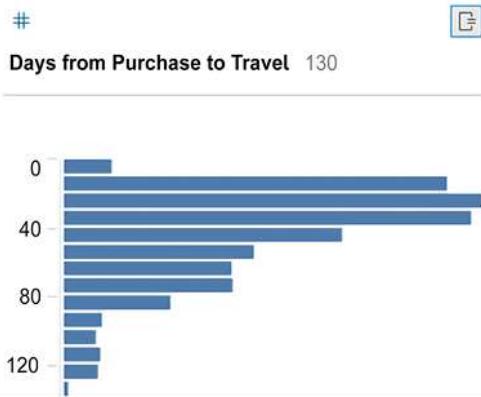

Figure 16.21: The calculated field shows up in the profile pane

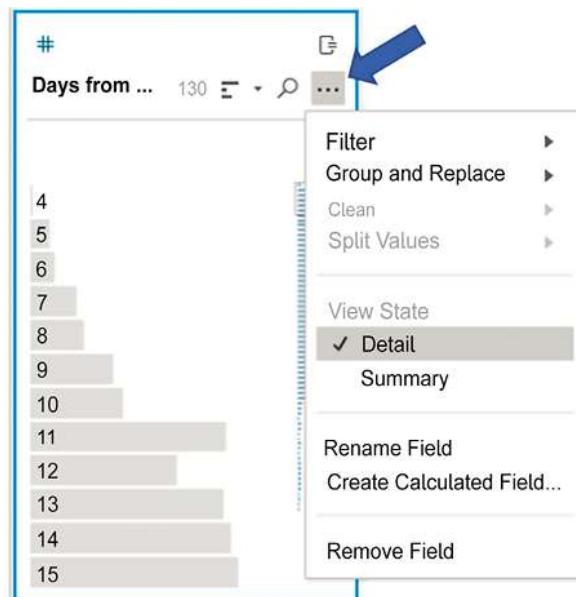

Figure 16.22: Numeric and date fields can be viewed in Summary or in Detail

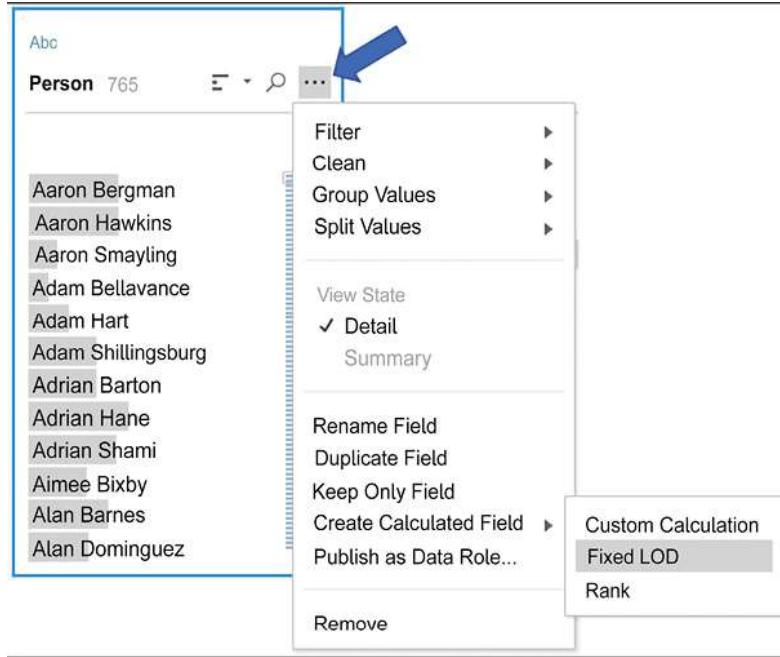

Figure 16.23: To create a Fixed LOD calculation, use the menu and select **Create Calculated Field | Fixed LOD**

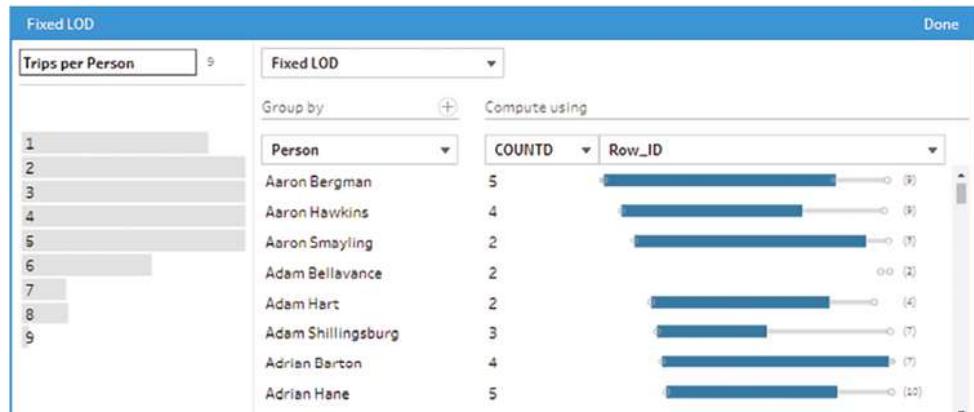

Figure 16.24: The Fixed LOD pane allows you to configure the LOD expression visually and get instant visual feedback concerning results

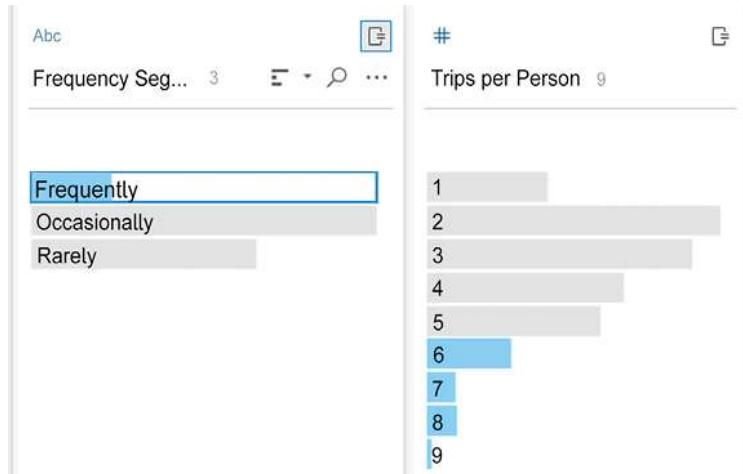

Figure 16.25: You can easily visualize how calculations relate to each other and other fields using the Profile pane

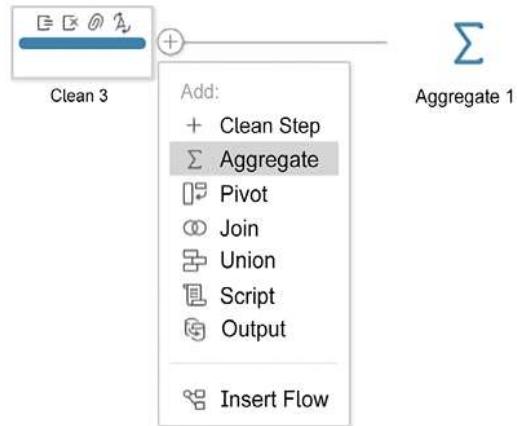

Figure 16.26: Adding an Aggregate step to the flow using the + symbol

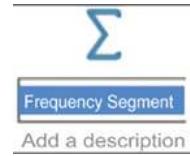

Figure 16.27: When editing the name of a step, you may also add a more verbose description to help document the step's purpose

Screenshot of the "Frequency Segment" step settings screen. The interface includes a header with "Frequency Segment" (2 Fields, 3 Rows), "Filter Values...", and search/filter tools. The main area is divided into three sections: "Settings" (Additional Fields, Grouped Fields, Aggregated Fields), "Changes (0)", and a list of available fields.

Settings tab:

- Additional Fields:** A list of fields categorized by type (e.g., GROUP, SUM) and description:
 - Abc GROUP Airline
 - # SUM Days from Purchase to Travel
 - Abc GROUP File Paths
 - Abc GROUP Passenger Email
 - Abc GROUP Person
 - 白 GROUP Purchase Date
 - Abc GROUP Route
 - # SUM Row_ID
 - Abc GROUP Ticket Type
 - 白 GROUP Travel Date
 - # SUM Trips per Person
 - # SUM Number of Rows (Aggregated)
- Grouped Fields:** A table showing grouped fields:

Abc	GROUP
	Frequency Segment 3
	Frequently
	Occasionally
	Rarely
- Aggregated Fields:** A table showing aggregated fields:

#	AVG
Ticket Price 3	149.56439393939394
	173.5090534979424
	181.2991150442478

Figure 16.28: Adding an Aggregate step to the flow using the + symbol

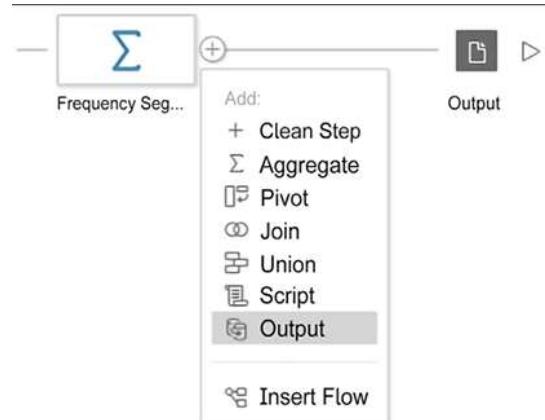

Figure 16.29: Adding an Output step to the flow using the + symbol

The screenshot shows the "Output" configuration dialog in Tableau Prep. The dialog title is "Output 2 fields". On the left, there are several configuration options:

- Save output to:** Set to "File". Below it is a "Browse" button.
- Name:** "Frequency Segment".
- Location:** "C:\Users\admin\Documents\My Tableau Prep Repository\Datasources".
- Output type:** "Comma Separated Values (.csv)".
- Write Options:** A note says "Select an option to create or update your output table." Below this are "Full refresh" and "Create table" dropdowns.

On the right, a preview table titled "Save to Frequency Segment.csv" is shown:

Frequency Segment	Ticket Price
Frequently	181.2991150442478
Rarely	149.56439393939394
Occasionally	173.5090534979424

At the bottom right of the dialog is a large blue "Run Flow" button.

Figure 16.30: This output will contain exactly three rows of data

The screenshot shows the Power BI Data View interface. At the top, it says "Employee Flights Fields selected: 10 of 10" and has a "Filter Values..." button. Below that, a note says "Select the fields to include in your flow. If you make changes to the data, the data source will be queried again." A table follows, with columns: Type, Field Name, Original Field Name, Changes, and Sample Values. The table contains four rows:

Type	Field Name	Original Field Name	Changes	Sample Values
#	Row ID	Row ID		4,144, 9,102, 2,194
Abc	Passenger Email	Passenger Email		eklefer@vizpainter.com, abarton@vizpainter.com, achung@vizpainter.com
File	Purchase Date	Purchase Date		01/10/2019, 09/10/2017, 10/22/2018
File	Travel Date	Travel Date		02/06/2019, 11/12/2017, 12/17/2018

Figure 16.31: The Filter Values... option allows you to filter values on the input step. This could improve performance on large datasets or relational databases

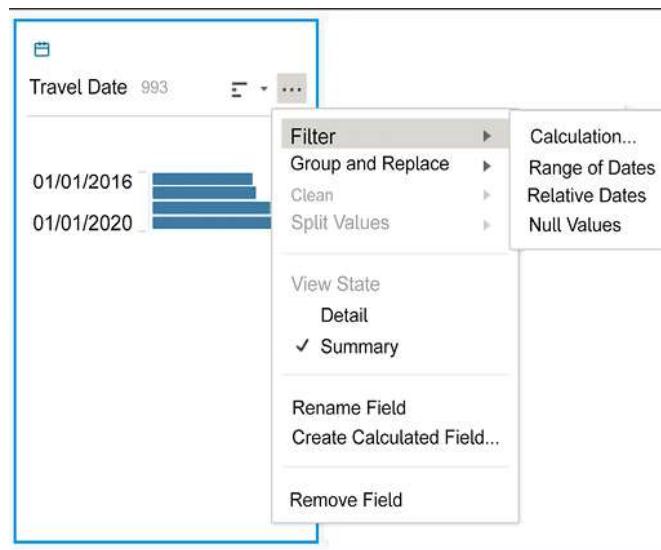

Figure 16.32: Filter options for a field include filtering by Calculation, Range of Dates, and Relative Dates, and keeping or excluding Null Values

Figure 16.33: Your flow should look similar to this (exact placement and colors of steps may vary)

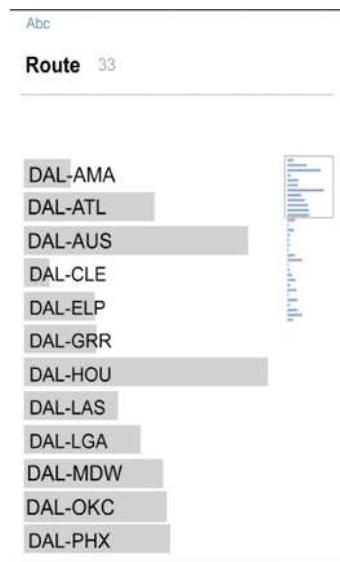

Figure 16.34: Route uses airport codes for origin and destination separated by a dash

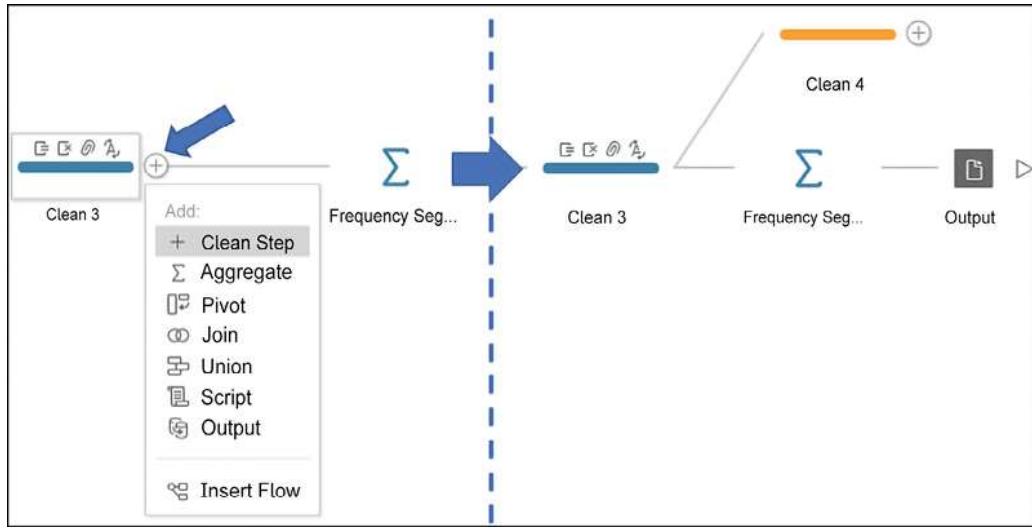

Figure 16.35: Adding to a step that already has an output adds a new branch to the flow

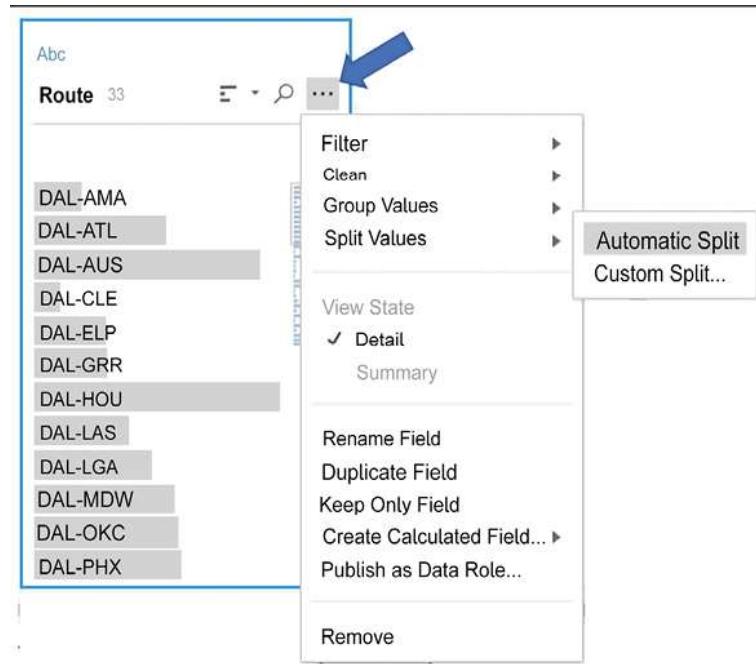

Figure 16.36: Split Values allows you to divide delimited strings into separate fields. Automatic Split attempts to determine the delimiter, while Custom Split... allows you greater options and flexibility

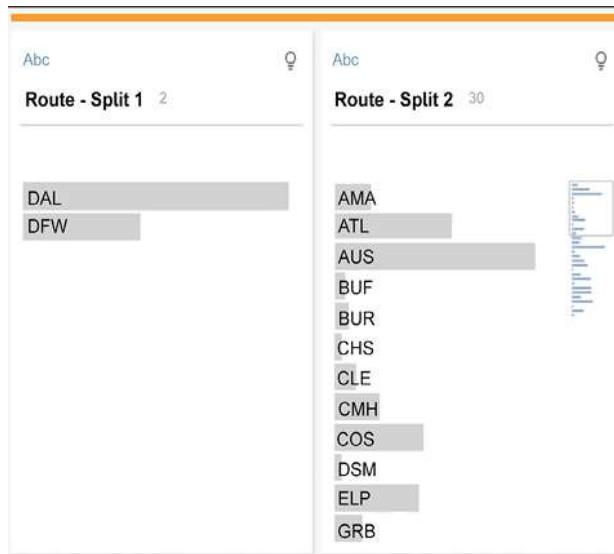

Figure 16.37: The results of the split will be new fields in the flow

Abc Extract Airport Code	Abc Extract Airport Name	Extract Latitude	Extract Longitude
BTI	Barter Island LRRS Airport	70.1340	-143.582
LUR	Cape Lisburne LRRS Airport	68.8751	-166.110
PIZ	Point Lay LRRS Airport	69.7329	-163.005
ITO	Hilo International Airport	19.7214	-155.048
ORL	Orlando Executive Airport	28.5455	-81.333

Figure 16.38: The hyper extract contains the data we'll need to supplement the flow with our own geospatial data

	Type	Field Name	Original Field Name
<input checked="" type="checkbox"/>	Abc	Airport Code	Airport Code
<input checked="" type="checkbox"/>	Abc	Airport Name	Airport Name
<input checked="" type="checkbox"/>	#	Latitude	Latitude
<input checked="" type="checkbox"/>	#	Longitude	Longitude

Tables

	Tableau Server	Tableau Cloud	Tableau Public
Description	A server application installed on one or more server machines that hosts views and dashboards created with Tableau Desktop.	A cloud-based service maintained by Tableau Software that hosts views and dashboards created with Tableau Desktop.	A cloud-based service maintained by Tableau Software that hosts views and dashboards created with Tableau Desktop or the free Tableau Public client.
Licensing cost	Yes	Yes	Free

Administration	Fully maintained, managed, and administered by the individual or organization that purchased the license.	Managed and maintained by Tableau Software with some options for project and user management by users.	Managed and maintained by Tableau Software. Users have some options for managing their content.
Authoring and publishing	Users of Tableau Desktop may author and publish workbooks to Tableau Server. Web Authoring allows Tableau Server users the capability to edit and create visualizations and dashboards in a web browser.	Users of Tableau Desktop may author and publish workbooks to Tableau Cloud. Web Authoring allows Tableau Cloud users the capability to edit and create visualizations and dashboards in a web browser.	Users of Tableau Desktop or the free Tableau Public client can publish workbooks to Tableau Public. Web authoring (currently in beta) allows users to create content with only a web browser.
Interaction	Licensed Tableau Server users may interact with hosted views. Views may also be embedded in intranet sites, SharePoint, and custom portals.	Licensed Tableau Cloud users may interact with hosted views. Views may also be embedded in intranet sites, SharePoint, and custom portals.	Everything is public-facing. Anyone may interact with hosted views. Views may be embedded in public websites and blogs.
	Tableau Server	Tableau Cloud	Tableau Public
Limitations	None except those based on licensing purchased and hardware used.	Most data sources must be extracted before workbooks can be published. Most non-cloud-based data sources must have extracts refreshed using Tableau	All data must be extracted and each data source is limited to 15 million rows.

		Desktop on a local machine or through the Tableau Bridge . Certain storage and load-time limits are also in place.	
Security	The Tableau Server administrator may create sites, projects, and users and adjust permissions for each. Access to the underlying data can be restricted, and downloading of the workbook or data can be restricted.	The Tableau Server administrator may create projects and users and adjust permissions for each. Access to the underlying data can be restricted, and downloading of the workbook or data can be restricted.	By default, anyone may download and view data; however, access to these options may be restricted by the author.
Good uses	Internal dashboards and analytics and/or use across departments/divisions/clients through multi-tenant sites.	Internal dashboards and analytics, especially where most data sources are cloud-based. Sharing and collaboration with remote users.	Sharing visualizations and dashboards with the public. Embedding dashboards on public-facing websites or blogs.
